

# Oregon

John A. Kitzhaber, MD, Governor

Department of Transportation

Office of the Director, MS 11

355 Capitol St NE

Salem, OR 97301-3871

**DATE:** April 2, 2013

**TO:** Oregon Transportation Commission

**FROM:** Matthew L. Garrett  
Director

**SUBJECT:** Consent 6 - Adoption of the Oregon 126 Fern Ridge Corridor Plan

**Requested Action:**

Request approval to adopt the Oregon 126 Fern Ridge Corridor Plan. Adoption of this corridor plan implements policies in the Oregon Highway Plan (OHP). Findings of compliance in support of this action are found in Exhibit B. Adoption of the corridor plan will constitute an amendment to the 1999 OHP.

**Background:**

The Oregon Department of Transportation (ODOT) has worked with the cities of Veneta and Eugene, Lane County, and the Lane Transit District to develop a 20-year plan to maintain the function of Oregon 126 (Florence-Eugene Highway and Beltline Highway). The plan identifies solutions to short- and long-term multimodal transportation issues through the 20-year planning period. The corridor plan has been adopted by Lane County and has been incorporated into the county's Comprehensive Plan and Transportation System Plan. Prior to its action, Lane County provided appropriate notice of public hearings to all agencies and individuals entitled to notice, including the Department of Land Conservation and Development (DLCD). No portion of the facility plan is located within the Cities of Veneta or Eugene, therefore, approval by those cities is not required. The corridor plan has also been endorsed by the Lane County Area Commission on Transportation. Lane County transmitted the notice of adoption to DLCD and other affected agencies on February 25, 2013, and no comments were received.

### **Findings of Compliance with OAR 731-015-0065 OR 126 Fern Ridge Corridor Plan**

ODOT's State Agency Coordination Agreement requires that the Oregon Transportation Commission (OTC) adopt findings of fact when adopting facility plans (OAR 731-015-0065). Pursuant to these requirements ODOT provides the following findings to support the OTC adoption of the OR 126 Fern Ridge Corridor Plan.

#### **731-015-0065**

##### **Coordination Procedures for Adopting Final Facility Plans**

(1) Except in the case of minor amendments, the Department shall involve DLCD and affected metropolitan planning organizations, cities, counties, state and federal agencies, special districts and other interested parties in the development or amendment of a facility plan. This involvement may take the form of mailings, meetings or other means that the Department determines are appropriate for the circumstances. The Department shall hold at least one public meeting on the plan prior to adoption.

*FINDING: The Department has involved DLCD, the cities of Veneta and Eugene, Lane County, and the Lane Transit District in development of this facility plan. An extensive public involvement program was also conducted and is documented in Appendix I of the Corridor Plan. The public meeting requirement is met by the Commission's adoption proceedings for this Corridor Plan.*

(2) The Department shall provide a draft of the proposed facility plan to planning representatives of all affected cities, counties and metropolitan planning organization and shall request that they identify any specific plan requirements which apply, any general plan requirements which apply and whether the draft facility plan is compatible with the acknowledged comprehensive plan. If no reply is received from an affected city, county or metropolitan planning organization within 30 days of the Department's request for a compatibility determination, the Department shall deem that the draft plan is compatible with that jurisdiction's acknowledged comprehensive plan. The Department may extend the reply time if requested to do so by an affected city, county or metropolitan planning organization.

*FINDING: Lane County has adopted the Corridor Plan and incorporated it into the County's Comprehensive Plan and Transportation System Plan. The County's staff report and adopting ordinance is found in Corridor Plan Appendix K. The Corridor Plan has also been endorsed by the Lane County Area Commission on Transportation.*

(3) If any statewide goal or comprehensive plan conflicts are identified, the Department shall meet with the local government planning representatives to discuss ways to resolve the conflicts. These may include:

(a) Changing the draft facility plan to eliminate the conflicts;

(b) Working with the local governments to amend the local comprehensive plans to eliminate the conflicts; or

(c) Identifying the conflicts in the draft facility plan and including policies that commit the Department to resolving the conflicts prior to the conclusion of the transportation planning program for the affected portions of the transportation facility.

*FINDING: No statewide goal or comprehensive plan conflicts have been identified with the Corridor Plan. Corridor Plan Appendix A addresses consistency with adopted state, regional, and local plans.*

(4) The Department shall evaluate and write draft findings of compatibility with acknowledged comprehensive plans of affected cities and counties, findings of compliance with any statewide planning goals which specifically apply as determined by OAR 660-030-0065(3)(d), and findings of compliance with all provisions of other statewide planning goals that can be clearly defined if the comprehensive plan of an affected city or county contains no conditions specifically applicable or any general provisions, purposes or objectives that would be substantially affected by the facility plan.

*FINDING: The Final Draft Corridor Plan is attached for the Commission's consideration. Corridor Plan Appendix A and Appendix K address compliance with applicable statewide planning goals and the comprehensive plan of Lane County.*

(5) The Department shall present to the Transportation Commission the draft plan, findings of compatibility with the acknowledged comprehensive plans of the affected cities and counties and findings of compliance with applicable statewide planning goals.

*FINDING: The Final Draft Corridor Plan is attached for the Commission's consideration. Corridor Plan Appendix A and Appendix K address compliance with applicable statewide planning goals. Appendix K also contains documentation of Lane County's adoption of the Corridor Plan and its incorporation into the County's Comprehensive Plan and Transportation System Plan.*

(6) The Transportation Commission shall adopt findings of compatibility with the acknowledged comprehensive plans of affected cities and counties and findings of compliance with applicable statewide planning goals when it adopts the final facility plan.

*FINDING: The Final Draft Corridor Plan is attached for the Commission's consideration. Corridor Plan Appendix A and Appendix K address compliance with applicable statewide planning goals and compatibility with the local comprehensive plan of Lane County.*

(7) The Department shall provide copies of the adopted final facility plan and findings to DLCD, to affected metropolitan planning organizations, cities, counties, state and federal agencies, special districts and to others who request to receive a copy.

*FINDING: The Department will provide copies of the Adopted OR 126 Fern Ridge Corridor Plan, including all required findings to DLCD, Lane County, the Cities of Veneta and Eugene, Lane Transit District and others who request a copy.*

## Section I. Introduction

The Highway 126 Fern Ridge Corridor Plan identifies improvement needs and develops solutions to address highway safety and mobility needs for all transportation system users of the six-mile corridor between the cities of Veneta and Eugene. The highway is an important regional connection for commuters, freight, residents, and tourists traveling between the two cities and to the Oregon Coast.

OR 126W is designated as a Statewide Highway and freight route and has a posted speed of 55 miles per hour through the project study area. The highway is intersected by numerous county roads and private driveways that access directly onto the highway. There are limited turn lanes from the highway to these side streets and driveways, and passing opportunities are limited during the peak periods due to heavy traffic volumes. The highway travels through an environmentally sensitive area and has limited connectivity and available right-of-way due to the adjacent railroad tracks and Fern Ridge Lake.

This plan is the first of what may be several

phases required to construct improvements along the corridor. Subsequent phases would consist of Phase 2 - environmental documentation to meet National Environmental Policy Act (NEPA) requirements and to select a preferred alternative, Phase 3 - preparation of construction plans, and Phase 4 – construction of improvements. This corridor plan is intended to:

- Develop a problem statement, purpose, needs, goals and objectives for the corridor
- Develop an understanding and inventory of the transportation and environmental conditions through the corridor
- Identify facility deficiencies and opportunities
- Create and evaluate conceptual alternative solutions
- Recommend the most viable solutions that can be implemented

**Figure 1: Study Area**

## Study Area

The study area extends along OR 126W from Huston Road on the west to Green Hill Road on the east, generally covering the rural area between the Urban Growth Boundaries for the cities of Veneta and Eugene (see Figure 1). This section of the highway has received little detailed analysis, unlike roadways within Veneta and Eugene where transportation system plans have been prepared. The Corridor Plan considered several alternatives along three potential routes, including the:

- OR 126W route from Huston Road to Green Hill Road
- Perkins Road, Central Road, Cantrell Road, and Crow Road route between Huston Road and Green Hill Road
- Territorial Highway, Clear Lake Road, and Green Hill Road route around Fern Ridge Lake

The outcome of this Corridor Plan was a set of preferred improvements to address operational and safety issues in the project study area.

## Project Purpose

The primary purpose of the Highway 126 Fern Ridge Corridor Plan was to identify corridor improvement options to safely and efficiently accommodate the needs of all roadway users, including pedestrians, bicyclists, motorists, freight and transit.

## Goals and Objectives

A set of goals and objectives was developed to outline how the project purpose would be realized:

1. **Transportation Goal:** Provide a multi-modal transportation system from Veneta to Eugene to meet existing and future safety and mobility needs for all transportation system users.
  - *Objective A. Improve safety for pedestrians, bicyclists, motor vehicles, freight, and transit*
  - *Objective B. Encourage use of alternative transportation modes*
  - *Objective C. Maintain/enhance motor vehicle/freight mobility and traffic flow*
  - *Objective D. Support freight mobility along the corridor*
  - *Objective E. Improve safety and efficiency at*

*railroad crossings*

- *Objective F. Avoid or minimize impacts to the railroad*
  - *Objective G. Improve reliability for emergency vehicles*
  - *Objective H. Provide a facility that meets future growth in the corridor*
  - *Objective I. Where appropriate support opportunities in the corridor for future rail transit service*
2. **Environmental Goal:** Minimize the impacts to local environmental and community resources while incorporating opportunities to enhance those resources.
    - *Objective A. Avoid or minimize adverse impacts to local environmental, visual, and community resources*
    - *Objective B. Support/seek opportunities for enhancements to local environmental and community resources*
  3. **Social and Economic Goal:** Support the economic viability of the region including industrial, commercial, recreational, and tourist activities; protect the livability and integrity of the residential areas; provide a financially viable project.
    - *Objective A. Support and enhance multi-*

*modal access for the residential, commercial, recreational, and tourist areas*

- *Objective B. Improve freight movement throughout the corridor*
  - *Objective C. Enhance transportation facilities which are accessible to all members of the community*
  - *Objective D. Support adopted economic plans*
  - *Objective E. Minimize capital costs while meeting project objectives*
  - *Objective F. Minimize disruption to the community resulting from highway construction and operation*
  - *Objective G. Maximize the cost effectiveness of transportation system investments*
  - *Objective H. Minimize impacts to private properties and farmland*
  - *Objective I. Support rail related freight opportunities for Veneta's industrial areas*
4. **Community Values Goal:** Be consistent with the adopted long term goals and policies of the community and the region.
    - *Objective A. Support community/regional facilities*
    - *Objective B. Consistent with adopted state, county, regional, and local Transportation System Plans and policies*

### The Evaluation Criteria

A variety of criteria was used to evaluate and compare the alternatives proposed for the Highway 126 Fern Ridge Corridor Plan. The individual evaluation measures for each criteria were derived from the project goals and objectives. For more information on the project goals, objectives, and evaluation criteria, see Appendix C and Appendix F.

**Transportation Goal:** Eleven measures used in this goal focused on minimizing conflict points; increasing motor vehicle, freight and emergency vehicle mobility; minimizing impacts to railroad service; and providing safe and accessible pedestrian, bicycle, transit, and motor vehicle facilities.

**Environmental Goal:** Seven measures were evaluated within this goal. These measures focused on minimizing adverse impacts to natural, historical, cultural, and visual resources; improving access to recreational areas; and supporting regional modal alternatives to the motor vehicle.

**Social and Economic Goal:** Nine measures were evaluated within this goal that focused on improving access to residential,

commercial, and recreational areas; providing accessible transportation facilities; limiting project costs and property related impacts; supporting freight and rail travel; and maintaining consistency with local economic development plans.

**Community Values Goal:** The ten measures used in this goal focused on consistency with state and local plans.

## Section 2. Existing Conditions and Demonstrated Needs

OR 126W between Eugene and Veneta is a two-lane highway where the existing multi-modal, safety, and operational needs are expected to worsen over time. The highway is an important regional connection for commuters, freight, residents and tourists traveling between the two cities and to the Oregon Coast. The highway also crosses an environmentally sensitive area and has limited connectivity and available right-of-way due to the adjacent railroad tracks and Fern Ridge Lake.

OR 126W is under ODOT jurisdiction and is classified as a Statewide Highway. It is also part of the National Highway System, and is a state freight route and a federally designated truck route. Between Huston Road and Green Hill Road, the width and layout of OR 126W varies. The typical layout of the street is configured as follows and shown in Figure 2:

- One 12-foot travel lane in each direction

- Paved shoulders ranging in width from four to ten feet
- Left-turn lanes at major intersections
- No sidewalks or bike lanes

**Figure 2: Typical Section of OR 126W Today**

## Multi-modal Considerations

The existing paved shoulders on OR 126W range from four to ten feet and could be used by cyclists; however, due to the high vehicle travel speeds along the corridor (often more than 55 miles per hour), there are no comfortable accommodations for pedestrian or bicyclists between the cities of Veneta and Eugene.

Along OR 126W, there are several places that attract walking and biking trips (activity generators. These include:

- Fern Ridge Lake
- Fern Ridge Trail System
- Fern Ridge Wildlife Area
- Perkins Peninsula County Park
- Bird watching
- Transit stops at Green Hill Road, Fisher Road, Central Road, Ellmaker Road and Huston Road
- Businesses between Huston Road and Ellmaker Road

## Multi-modal Needs

Overall, the following multi-modal needs were identified along the OR 126W study corridor (for more information on the multi-modal needs in the study area, see Appendix B):

- A walking connection between Veneta and Eugene, with access to activity generators between the two cities
- A biking connection between Veneta and Eugene, and to activity generators between the two cities
- Accessible bus stops
- Improved bus stop amenities, such as bus pullouts, shelters, lighting, or park-and-rides

## Safety Considerations

OR 126W is a two-lane rural highway that lacks pedestrian and bicycle facilities. On an average day, the highway carries approximately 14,500 vehicles, increasing to nearly 18,000 vehicles per day in the peak summer months. The posted speed is 55 miles per hour; however, most drivers travel at or below speeds of 62 miles per hour.<sup>1</sup>

The OR 126W corridor between Veneta and Eugene also has an above average crash rate compared to other similar highways in Oregon (between 2005 and 2009); and the highway has averaged two fatalities or debilitating injuries per year over the past 15 years (see Figure 3). The following factors could be contributing to the high collision frequency along the corridor:

- Narrow shoulders
- Railroad alignment along the south side
- Fern Ridge Lake on both sides of the

---

<sup>1</sup> As determined by the 85<sup>th</sup> percentile speed for the corridor, which is defined as the speed below which 85 percent of the vehicles are traveling.

middle section

- Numerous closely spaced driveways at the western end
- Pavement ruts

In addition, there are several unsignalized streets and driveways that access the corridor but have no left- or right-turn lanes. Drivers attempting to turn at these locations are often forced to stop or slow in the travel lanes, which causes queuing and increases the potential for rear-end collisions. The collision evaluation showed that the access density along the corridor has contributed to increased collisions.

Pedestrians or bicyclists have been involved in five collisions along the OR 126W study corridor over the past 15 years. The lack of pedestrian and bicycle facilities could be contributing factors and could also limit use of the corridor by walkers and bikers.

Although safety issues have been identified, there are no locations along the study corridor that rank among the top ten percent of state highways in Oregon for collision frequency or severity (no top 10% SPIS sites).

## Safety Needs

Overall, the following safety needs were identified along the OR 126W study corridor (for more information on the safety needs in the study area, see Appendix B):

- Reduce the collision potential
- Create safe passing opportunities
- Establish more reliable emergency response times
- Manage access points by consolidating driveways to adjacent properties
- Provide left- and right-turn lanes at major streets and driveways
- Accommodate all users

## Operational Considerations

Today, intersections along the OR 126W corridor meet ODOT's target for intersection operations.<sup>2</sup> But by 2035, increased vehicular volumes are expected to cause several intersections to become substandard (not meeting the intersection volume to capacity target). The large through traffic volumes on OR 126W would generally be expected to increase the delay drivers experience at side street approaches to the highway. Drivers will require more time to find an acceptable gap in traffic to make a left turn onto the highway, thereby, reducing the lane capacity of the side street. The following intersections are expected to be substandard by 2035 (see Figure 4):

- OR 126W/Green Hill Road
- OR 126W/Huston Road
- OR 126W/Shady Rest Drive
- OR 126W/Lake Side Drive

<sup>2</sup> Outside Urban Growth Boundary, ODOT Freight Route on a Statewide Highway, Stop-controlled side street with a maximum volume to capacity ratio of 0.80. Oregon Highway Plan, Table 6, August 2005.

- OR 126W/Central Road
- OR 126W/Fisher Road
- OR 126W/Richmond Street
- OR 126W/Ken Nielsen Road

In addition to the intersection-level analysis of the corridor, a segment-level traffic operations analysis was conducted on OR 126W between Ellmaker Road to Green Hill Road. This analysis also indicated that the corridor is expected to be substandard by the year 2035. Additional through capacity is needed on OR 126W to accommodate higher traffic volumes and support the continued growth of Veneta, Eugene, and the Oregon Coast.

## Operational Needs

Overall, the following operational needs were identified along the OR 126W study corridor (for more information on the operational needs in the study area, see Appendix B and Appendix D):

- Increase roadway capacity to accommodate through traffic volumes during the summer
- Design an accessible and adaptable roadway that accommodates users with varying travel patterns and driving characteristics including local, commuter, freight, and recreational trips

**Figure 4: OR 126W Operational Needs**

## Environmental and Other Considerations

OR 126W travels through environmentally sensitive areas and the roadway has limited connectivity and available right-of-way due to its proximity to the parallel Coos Bay rail line and Fern Ridge Lake.

The design of project alternatives within the study area was guided by regulatory requirements and considerations for avoiding and minimizing impacts to the following sensitive resources and features (see Figure 5):

- Wetlands and other water resources
- Fern Ridge Lake
- Fern Ridge Wildlife Area
- Perkins Peninsula County Park
- Willamette daisy, Fender's blue butterfly and Kincaid's lupine critical habitat
- Coos Bay rail line
- Potential historic structures
- Hazardous material sites

Additional information relating to environmental constraints within the study area is provided in Appendix H.

It is anticipated that ODOT will obtain federal funds to implement improvements recommended in the Highway 126 Fern Ridge Corridor Plan. Therefore, the project would be required to comply with the National Environmental Policy Act (NEPA) and other relevant federal, state, and local laws and regulations.

The Corridor Plan will be used by ODOT to identify the type of NEPA environmental documentation (Class 1, 2 or 3) that is ultimately required when selecting a preferred alternative. The Corridor Plan will also support development of NEPA documentation in the project's next phase.

## Section 3. Public Process

The Highway 126 Fern Ridge Corridor Plan was a collaborative process among various public agencies, key stakeholders and the community. Throughout this project, the project team took time to understand multiple points of view, obtain fresh ideas and resource materials, and encourage participation from the community.

Project staff conducted individual interviews, hosted small focus group meetings and regular meetings with decision makers, and conversed informally with members of the community. At key stages, project staff also held three public workshops (or community forums) that gave residents an opportunity to learn about the study and contribute their concerns on how the corridor might be improved. This section summarizes this public process and the ideas generated by the community at the three community forums. For more information on the public process, see Appendix I.

### Community involvement played a key role in the development of the Corridor Plan

#### Stakeholder Interviews/Focus Groups

Key project issues and potential transportation solutions were brainstormed

#### Community Forum #1

The community provided feedback on the project alternatives

#### Community Forum #2

The community provided feedback on the first screening process (tier 1)

#### Community Forum #3

The community provided feedback on the second screening process (tier 2)

#### Corridor Plan

## What Issues Matter to the Community?

Between May and August 2011, forty stakeholder interviews were conducted to help identify the following key project issues:

- Address the needs of all corridor users
- Improve safety and accessibility
- Support economic viability
- Enhance environmental conditions
- Minimize impacts to property owners, residents, and businesses
- Improve multi-modal options and access

Stakeholders helped to identify four specialized focus groups with concerns in the corridor, including:

- Focus Group #1: Corridor users, such as commuters, tourists, and freight truck drivers who travel through the corridor
- Focus Group #2: Multi-modal users and planners for the corridor, such as bicycle advocates and transit service

providers

- Focus Group #3: Non-profit and agency organizations with environmental programs or regulatory authority in the corridor, such as conservation groups and federal and state natural resource agencies
- Focus Group #4: People who live and / or work along the corridor, such as residents and business owners

The focus groups met between June and September 2011. These groups provided feedback on the project's goals and objectives and on the needs and deficiencies of the OR 126W corridor, and they brainstormed solutions to address roadway safety and congestion. Their input guided the project team in developing transportation solutions.

## Community Forum #1

On October 6, 2011, the first of three community forums was held. At this first community forum, the project team presented an overview of the project, opportunities and constraints information and possible project options. Participants commented on the project's problem statement, purpose and need statement, goals and objectives, and several alternatives.

Eight alternatives (summarized in Figure 7a and Figure 7b) along three potential routes were presented at Community Forum #1 (for more information on project alternatives, see Appendix E):

**OR 126W Route:** The five alternatives considered along the OR 126W route from Huston Road to Green Hill Road (see Figure 6) were doing nothing (No Build), transportation system management improvements, spot improvements, and roadway widening to three or four lanes.

**Southern Route:** Two alternatives considered along the Perkins Road, Central Road, Cantrell Road, and Crow

Road route between Huston Road and Green Hill Road (see Figure 6) were widening various segments of this route to three travel lanes and widening portions of the shoulder as appropriate or adding a multi-use trail for pedestrian and bicycle travel.

**Northern Route:** One alternative was considered along the Territorial Highway, Clear Lake Road, and Green Hill Road route around Fern Ridge Lake (see Figure 6). This alternative would widen various segments of this route to three lanes and widen portions of the shoulder as appropriate.

Figure 6: Routes Considered for Improvements

**Figure 7a: The Eight Alternatives**

**OR 126W Route No-Build Alternative** would construct no improvements. OR 126W would maintain one travel lane in each direction, with left-turn lanes where they currently exist. The shoulders would continue to vary in size.

**OR 126W Route Transportation System Management Alternative** would include no roadway widening (OR 126W would maintain the existing cross-section). Lower cost improvements would be implemented such as improved signing and roadway striping, alternate mobility standards or transit and access management enhancements.

**OR 126W Route Spot Improvement Alternative** would modify OR 126W where practical to include additional turn lanes, intersection improvements and shoulder widening. The shoulders would continue to vary in size and the roadway would transition between two and three lanes.

**OR 126W Route Three Lane Alternative** would widen OR126W to include one travel lane in each direction and a center lane for either turning or passing as appropriate. The shoulders would be widened to eight feet.

## Figure 7b: The Eight Alternatives

**OR 126W Route Four Lane Alternative** would widen OR126W to include two travel lanes in each direction. The shoulders would be widened to eight feet. Dedicated left-turn lanes would be added where appropriate.

**Southern Route Two/Three Lane Alternative** would modify Perkins and Cantrell Roads where needed to include additional turn lanes and widened shoulders. The roadways would transition between two and three lanes.

**Southern Route Multi-use Path Alternative** would construct a multi-use path for pedestrian and bicycle travel between Huston Road and Green Hill Road generally near the Perkins and Cantrell Road alignments. No additional roadway improvements would be constructed (OR 126W would maintain the existing cross-section).

**Northern Route Alternative** would modify Territorial Highway, Clear Lake, and Green Hill Roads where needed to include additional turn lanes and widened shoulders. The roadways would transition between two and three lanes.

### Community Preferred Alternatives

At Community Forum #1, project staff asked community members to fill out a survey indicating which alternative they prefer. The majority of respondents said they liked the OR 126W Route Four Lane Alternative or the OR 126W Route Spot Improvements Alternative. The alternatives for Transportation System Management and three lanes along the OR 126W Route were also preferred by a few community members.

The separated multi-use path alternative was favored by most community members in attendance, but only if this alternative was combined with another alternative that would improve OR 126W (such as widening to four lanes). Ultimately, all of the alternatives were advanced for further refinement and community review.

## Community Forum #2

On January 24, 2012, the second of three community forums was held where the results of the first screening and evaluation process was presented. Participants commented on the project alternatives and design options recommended for further study in Community Meeting #1.

Several design options were developed to supplement the eight project alternatives under consideration:

- **A separated multi-use path:** Providing a separated multi-use path for pedestrian and bicycle travel would be beneficial when compared to the same alternative without that option. It was also evident based on public input that a separated multi-use path would be preferred to bicycle facilities adjacent to the highway. For the purposes of comparing project alternatives, the project team developed a separated multi-use path design option (see Figure 8) that could be constructed either adjacent to OR 126W or along the southern route (via Cantrell and Perkins Roads) and that could be added to any alternative. This option would more comfortably and safely

accommodate pedestrian and bicycle modes.

- **OR 126W Causeway Options:** Widening the highway under the three- or four-lane alternative would require modifying the existing dike across Fern Ridge Lake. Two causeway options were considered, as shown in Figure 9, including widening the existing dike to support the expanded roadway or replacing the dike with support piers to improve water flow under the roadway. Since subtle differences would be expected between the two causeway options for most evaluation criteria, they were evaluated as separate design options. Therefore, the three- and four-lane alternatives for OR 126W were each evaluated with a causeway on a dike and a causeway on piers.

**Figure 8: Multi-use Path Design Option**

**Figure 9: OR 126W Causeway Design Options**

### Alternatives Advancing to the Second Screening Process

Overall, the top three alternatives from the Tier 1 screening determined to have the greatest likelihood to meet the project goals and objectives were advanced to the second screening process (Tier 2):

- OR 126W Route Four-Lane Alternative with Causeway on Dike
- OR 126W Route Three-Lane Alternative with Causeway on Dike
- OR 126W Route Spot Improvements

The No-Build Alternative, although ranked the lowest in meeting the project goals and objectives, was required to be advanced and compared to the improvement alternatives throughout the project development and NEPA documentation process.

The OR 126W Spot Improvements offer short-term modifications that would be consistent if either the three- or four-lane improvement alternative is chosen as a long-term solution for the corridor. The southern route alternative along Perkins and Cantrell Roads would have a moderate effect on

mobility and safety through the OR 126W corridor; however, this alternative would not effectively supplement a long-term solution along the OR 126W corridor.

Therefore, the third alternative recommended for advancement to the second screening process was the OR 126W Route Spot Improvements. The following design options were also evaluated with the alternatives that advanced to the second screening process:

- A separated multi-use path
- Causeway on piers

## Community Forum #3

On May 8, 2012, the third community forum was held. At this community forum, the result of the Tier 2, screening and evaluation process was presented (see Figure 11). Participants commented on whether they agreed with the recommended project alternatives and design options that were derived from the Tier 2 screening and evaluation process.

**Figure 11: Result of Tier 2 Screening and Evaluation Process**

|                        | OR 126W-<br>No Build | OR 126W-<br>Spot Improvements | OR 126W- 3 lanes<br>with Causeway on Dike | OR 126W- 4 lanes<br>with Causeway on Dike |

OR 126W Route

## How did the Alternatives Compare to One Another?

In the Tier 2 screening evaluation, each alternative was evaluated and rated based on how well it achieved the measures set for each of the criteria; scoring was on a scale from one (poor achievement) to five (best achievement). The Tier 2 screening involved a more detailed evaluation of each alternative that included conceptual drawings, traffic operations and capacity, cost estimates, and constructability. The evaluation was intended to help distinguish differences between the alternatives and aid decision makers in determining which alternative best met the various project criteria.

Overall, the alternative determined to have the greatest likelihood of meeting the project goals and objectives was the OR 126W Four-Lane Alternative. The OR 126W Three-Lane Alternative ranked a close second. The Spot Improvements and the No Build Alternative were ranked a distant third and fourth, respectively.

## Corridor Operation Comparison

The OR 126W Four-Lane Alternative performed the best with all study intersections meeting mobility targets through 2035. The No Build, Three-Lane and Spot Improvement Alternatives had several study intersections that would not meet mobility targets through 2035.

## Walking and Biking Comparison

All alternatives assumed a separated multi-use path along one of two alignments, either adjacent to OR 126W or via Cantrell and Perkins Roads.

## Cost Comparison

**OR 126W Spot Improvements with separated multi-use path: \$15 million**

**OR 126W Three-Lane Alternative with separated multi-use path**

- Causeway on Dike: \$95 million
- Causeway on Piers: \$145 million

**OR 126W Four-Lane Alternative with separated multi-use path**

- Causeway on Dike: \$130 million
- Causeway on Piers: \$195 million

### Outcome of the Tier 2 Screening Process

The following improvements, derived from the more rigorous Tier 2 screening process, are recommended for the Highway 126 Fern Ridge Corridor (for more information on the Tier 2 screening and evaluation process, see Appendix G and Appendix H):

- **OR 126W Four-Lane Alternative:**

This alternative was determined to have the greatest likelihood to meet project goals and objectives and is the preferred alternative by the community.

This alternative could be accomplished either by widening the existing dike to support the expanded roadway or replacing the dike with support piers to improve water flow under the roadway. The selection of the causeway design option will likely be determined through the NEPA and Project Development process.

- **Spot Improvements Alternative as an interim solution:** This alternative could serve as an interim solution to achieve some of the project goals and objectives in the short-term due to the higher construction costs of the OR 126W Four-Lane alternative.

- **Separated Multi-use Path Design Option:** It is recommended that the separated multi-use path design option along Perkins Road, Cantrell Road and Ken Nielsen Road be advanced. Since there were negligible differences between the two pathway options, the multi-use path adjacent to OR 126W should also be moved forward for further evaluation.

The selection of the multi-use pathway design option will likely be determined through the next phase of the overall project.

Of the 61 respondents at Community Forum #3, 95 percent strongly support the outcome of the Tier 2 screening process.

## Section 4. Recommended Corridor Plan

The recommendation for the Highway 126 Fern Ridge Corridor Plan is the Four-lane Alternative. Based on the stakeholder interviews, specialized input group discussions and feedback from the community forums, this alternative offers a vision for OR 126W that best meets the diverse needs of all users of the corridor.

### Long Term Recommendation

The OR 126W Four-Lane Alternative was determined to have the greatest likelihood to meet the project goals and objectives and is recommended as the long-term design for the corridor. The separated multi-use path design option, either adjacent to OR 126W or along the southern route (via Cantrell and Perkins Roads) is also recommended with the long-term plan. This path is planned to connect Veneta with the end of the existing Fern Ridge Trail just north of the OR 126W/Green Hill Road intersection. Under both alignments, the separated multi-use path could run adjacent to OR 126W or

along the railroad tracks between Ken Neilsen Road and Green Hill Road.

Two typical roadway section designs were developed for OR 126W, including designs for constrained (Figure 12) and very constrained right-of-ways (Figure 13). Note that the typical sections show an adjacent multi-use path; however, the ultimate alignment (adjacent to OR 126W or along the southern route via Cantrell and Perkins Roads) will likely be determined through

the NEPA and Project Development process.

The recommended corridor design and the associated typical section can be seen in Figures 14a to 14g. The multi-use path design option adjacent to OR 126W can also be seen in Figures 14a to 14g. The multi-use path design option along the southern route (via Cantrell and Perkins Roads) can be seen in Figure 15.

**Figure 12: Constrained 4-Lane Section with adjacent Multi-Use Path**

Figure 15: Recommended Corridor Plan: Separated Multi-Use Path Design Option along the Southern Route

Additional Turn-lanes

Example of a Bus Pull-out

Image source: WSDOT

### Short-term Recommendations

The Spot Improvements Alternative was recommended as an interim solution to achieve some of the project goals and objectives in the short-term due to the higher construction costs of the OR 126W Four-Lane Alternative. As shown in Figures 16a and 16b, the short-term recommendations include walking and biking, transit, and motor vehicle safety and capacity enhancements.

#### Walking and Biking

Short-term walking and biking recommendations were:

- Investigate crosswalks and enhanced crossing treatments along OR 126W
- Add sidewalk connections from marked crossings on OR 126W to bus stops
- Add street lighting

#### Transit

Short-term transit recommendations were:

- Relocate bus stops to the far side of intersections

- Add bus pull-outs, landing pads, benches and shelters at bus stops

#### Motor Vehicle Safety and Capacity

Short-term motor vehicle safety and capacity recommendations were:

- Investigate the potential for traffic signals at intersections in close proximity to the railroad crossing
- Add left- and right-turn lanes
- Add advanced intersection warning signs

Figure 16a: Recommended Spot Improvements: Huston Road to Central Road

Figure 16b: Recommended Spot Improvements: Central Road to Green Hill Road

## Access Management Plan

A key element of the Highway 126 Fern Ridge Corridor Plan is the long-range preservation of operational efficiency and safety of any proposed improvements in managing access to the highway. Access points- where side roads or driveways intersect the highway- are potential locations for vehicle conflicts. Vehicles frequently stop or slow down at these access points, which can significantly degrade the flow of traffic and reduce the efficiency of the transportation system. By reducing the number of access points and separating them more widely, the impacts of these conflicts can be minimized.

### Access Strategies

Short-, medium-, and long-range strategies have been identified for managing access to OR 126W:

#### Short-Range Strategies

- Implement turn lanes at driveways and intersections
- Install non-traversable medians to restrict turning movements. A short-

term solution is to stripe a solid double yellow line with yellow cross-hatching between the lines. In the future, the striped median could be replaced with a physical median or barrier.

#### Medium-Range Strategies

- Consider sharing or consolidating access points when/if properties are redeveloped in the future
- Reconsider the short-range strategies previously discussed, such as restriping roadways to establish turn lanes or installing non-traversable medians

#### Long-Range Strategies

- Provide a connection to Wildwood Road for the properties along the north side of OR 126W between Huston Road and Ellmaker Road to connect properties to the local street network that currently depend on OR 126W for access

## Section 5. Adoption and Implementation

This section presents the plan elements that are intended to adopt, implement and monitor the Highway 126 Fern Ridge Corridor Plan.

### Implementation

It is important to note that the recommended transportation improvements identified in the Four-Lane Alternative are not guaranteed to be funded and implemented during the planning horizon. Consequently, these projects cannot be relied upon to support plan amendments or zone changes and to achieve compliance with Oregon Administrative Rule 660-012-0060 unless or until they are included in the adopted Statewide Transportation Improvement Program (STIP) or a specific funding source is identified and supported by ODOT in writing. The projects recommended in this document simply represent state and local

agreement about transportation system needs in the OR 126W project study area that have been identified through extensive analysis.

The transportation improvements identified in the Spot Improvements Alternative are of a type or scale that ODOT believes can be implemented through some combination of state and/or local funds. The Spot Improvements can, therefore, be considered reasonably likely to be completed within the 20-year planning period.

To ensure that the Corridor Plan remains relevant and flexible enough to respond to changes over time, the following steps should be implemented by the affected jurisdictions. At a minimum:

- ODOT and Lane County should develop an interagency funding strategy outlining improvement prioritization,

affected area, agency roles and responsibilities, and necessary condition of approval revisions to previously-approved land uses. As part of this process, the jurisdictions should consider how the Corridor Plan could impact previous land use decisions and approval conditions.

- ODOT and Lane County should review right-of-way and access management needs for the long-term solutions prior to adopting local plan amendments or as part of local land use actions.
- ODOT and Lane County should develop an interagency monitoring program that includes safety and operational review to determine the need for and timing of improvements.

**Corridor Plan Monitoring and Updates**

The purpose of the Highway 126 Fern Ridge Corridor Plan is to ensure that safety and operational constraints are addressed for highway users through the 20-year horizon. The corridor plan should remain dynamic and responsive to development and changes to the adopted land use and transportation plans. To accomplish this, Lane County and ODOT should agree on a monitoring process that identifies triggers for reviewing the Corridor Plan and how development within the surrounding area will be reviewed and coordinated with all parties.

Periodically, the program for implementing the Corridor Plan may need to be evaluated to ensure it is meeting the needs of the managing agencies. Events that could trigger a review of the corridor plan include:

- Safety issues that have been identified by periodic review of crash data, statewide ranking and prioritization, and findings from traffic impact studies.
- Mobility failures that have been identified through periodic agency

review and findings from traffic impact studies.

- Zone change applications.

## Endorsement

- This plan received endorsement from the Lane County Area Commission on Transportation on August 8, 2012.

## Adoption

The adoption sequence has proceeded as follows:

- The plan was unanimously recommended by the Lane County Planning Commission on October 2, 2012.
- This plan was adopted as a refinement plan to the Lane County TSP according to Ordinance No. PA 1297 on February 12, 2013.

Final Step:

- Schedule the Oregon Transportation Commission adoption hearing to consider amending the Oregon Highway Plan to include the Highway 126 Fern Ridge Corridor Plan.

**Appendix A. Technical Memorandum #1, Highway 126 Fern Ridge Corridor Plan – Transportation Review of Plans, Policies, Regulations, and Standards (DKS, 2011)**

## TECHNICAL MEMORANDUM #1

**TO:** Project Management Team

**FROM:** Scott Mansur, P.E., P.T.O.E., DKS Associates  
Peter Coffey, P.E., DKS Associates  
Brad Coy, E.I.T., DKS Associates

**DATE:** September 12, 2011

**SUBJECT:** OR 126W Fern Ridge Corridor Plan – Transportation Review  
of Plans, Policies, Regulations, and Standards (Task 3)

P09042-019-003

---

This memorandum documents the prior plans, policies, regulations, and standards that are applicable to OR 126 between Veneta and Eugene, Oregon. It identifies the applicable information, relationships, conflicts, and discrepancies of the various documents. This review memorandum will be used as a resource in the preparation of the OR 126W Fern Ridge Corridor Plan to help ensure that the plan builds off of past effort, addresses any outstanding issues, and fits into the larger regional context.

This resource memorandum is divided into two parts. First, it lists key issues and recommendations identified in prior studies and plans that have findings or guidelines relevant to the project corridor. Second, it provides general documentation of the prior plans, policies, regulations, and standards.

### Key Transportation Issues and Recommendations

The key issues and recommendations identified in prior studies and plans that have findings or guidelines relevant to OR 126 between Veneta and Eugene are provided in the following list:

- The *Interim Corridor Strategy: Highway 126 West* provides corridor planning framework and was intended to be used as the starting point for the development of a Corridor Plan for OR 126 from Florence to Eugene. It also recommended a refinement plan (and identified a few potential improvement ideas) addressing safety and congestion for the segment from Veneta to Eugene to explore alternatives through a community consensus-building process.
- The other corridor-related studies further identify corridor concerns and provide potential improvement ideas that should be considered.
- The City of Veneta studies outline goals and objectives of the City. They also identify various improvements, particularly on the west end of the study corridor.
- The City of Eugene (and overall Central Lane MPO) studies outline goals and objectives of the Eugene-Springfield area. They also identify various improvements, particularly on the east end of the study corridor.

- The Lane County studies outline goals and policies for the County. They also identify various improvements, particularly on the side streets that intersect OR 126 in the rural area between Veneta and Eugene.
- The ODOT plans provide information and standards that are applicable to OR 126, including:
  - o The OR 126 project study area corridor is classified as a Statewide Highway. It is also part of the National Highway System (NHS), is a State Freight Route (FR), and is a Federally Designated Truck Route (TR). The eastern section of the corridor is part of the Beltline Highway (Highway #569), and the western section is part of the Florence-Eugene Highway (Highway #62).
  - o Goals, policies, and standards are provided for each transportation mode to be serviced on the corridor.
  - o Access spacing standards (1,320 feet given 55 mile per hour speed limit)
  - o Oregon Highway Plan (OHP) mobility standards (vary between 0.70 and 0.80 for intersections and free movements and between 0.80 and 0.90 for side street stopped approaches depending on corridor segment)
  - o Highway Design Manual (HDM) mobility standards (vary between 0.60 and 0.75 depending on corridor segment)
  - o Implementation resources are provided that guide the preparation and adoption of facility plans.

## Background Documents

The background documents that were reviewed include plans, policies, regulations, and standards relevant to OR 126 between Veneta and Eugene. Documents were obtained from the City of Veneta, the City of Eugene, Lane County, and the Oregon Department of Transportation (ODOT). A list of the documents reviewed and the page in this memorandum where each document is summarized is provided below:

The following environmental plans were not reviewed as part of this transportation memorandum; however, they have been reviewed by project team members and their related discussion is attached to this memorandum in the appendix:

- Oregon DFW Draft Fern Ridge Area Wildlife Management Plan (2009)
- Oregon DFW Long Tom Sub-basin Fish Management Plan (1992)
- USACE Fern Ridge Lake Shoreline Management Plan (1997)
- USACE Fern Ridge Lake Operational Management Plan (1998)
- Lane County Parks and Open Space Master Plan Update (2009)

The appendix to this memorandum also includes a policies and codes review. This additional review identifies any existing policies or codes that might result in land use or transportation scenarios inconsistent with the goals and objectives of the OR 126 Facilities Plan.

### ***Interim Corridor Strategy: Highway 126 West***

*April 1998, Oregon Department of Transportation, Region 2*

This report covers the section of OR 126 from Highway 101 in Florence to Interstate 5 in Eugene. It was prepared as a long-range plan for managing and improving transportation facilities and services to meet the needs for moving people and goods. This corridor plan assists in the development of transportation projects for implementation through the *Statewide Transportation Improvement Program* (STIP). It was prepared for this particular corridor due to its statewide significance: OR 126 West is an important route for national, state, regional, and local users and is a significant route for commuters, tourists, and truck traffic. It is the primary route connecting the central Oregon Coast

to the Eugene-Springfield metropolitan area in the southern Willamette Valley. It is critical in regards to regional connectivity in southwest Oregon.

The Interim Strategy was submitted to the OTC, Lane County, LTD, and the cities of Eugene, Veneta, and Florence for endorsement. After being endorsed, it was intended that the strategy would inform the agencies' transportation plans and comprehensive land use plans as appropriate. In addition, the Interim Strategy would be used as the starting point for the development of a Corridor Plan. The Corridor Plan would include further technical analysis and public outreach, with the intended result being prioritized project lists (based on short- and long-term costs and benefits) for each jurisdiction that has the responsibility for implementation as appropriate. The project lists would also include cost estimates and financing strategies. The final Corridor Plan would then be adopted by ODOT as an element of the state transportation system plan.

The Interim Corridor Strategy includes the following chapters:

- Executive Summary
- Chapter 1: Overview of Corridor Planning
- Chapter 2: Highway 126 West Corridor Overview
- Chapter 3: Existing Conditions and Facilities
- Chapter 4: Future Conditions
- Chapter 5: Issues, Opportunities, and Constraints
- Chapter 6: Interim Corridor Strategies

Specific public comments, analysis findings, and strategy recommendations from the strategy for the section of OR 126 from Veneta to Eugene include the following:

#### **Safety and Crash Profile**

- Two of the four fatalities on the corridor between 1994 and 1996 occurred between Veneta and the Beltline Highway in Eugene. This is a proportionately high number of fatalities (relative to total collisions) compared to the other corridor segments.
- Safety was one of the most frequently cited public concerns for the corridor. Curves, rain, and darkness were three of the main contributors to unsafe conditions, especially in locations where there are higher traffic volumes, the road is narrower, and there are ruts in the pavement. In addition, the lack of shoulders creates difficulties for service vehicle and emergency situations. Priority locations along the corridor should be identified.

#### **Public Transit**

- The Strategy recommends working with existing providers to improve transit service and inter-modal links along the corridor; specifically, proposes that Lane Transit District (LTD) improve bus service within the City of Veneta and from Eugene to Veneta, including a Park-and-Ride in Veneta with convenient express service to Eugene.

### **Bicycles**

- The Strategy recommends widening shoulders as needed (specific sections to be mapped in Phase II); particular concern for the section between Veneta and Eugene. Constraints include varying shoulder widths, limited alternative routes, geographic constraints, and environmental issues.
- The Eugene Bicycle Coalition recommended designating a bike route from Territorial Road to Eugene: travel east on East Bolton Road, south on Huston, east on Perkins, east on Cantrell, and north on Nielson to Highway 126, where cyclists would cross at Willow Creek and use the Fern Ridge Path the remainder of the way to Eugene. This would require repaving gravel on Cantrell and Nielson and signing the route.

### **Pedestrians**

- There are no sidewalks along the corridor. The need for pedestrian facilities along the corridor was not a large concern for corridor users due to reliance on the automobile. However, facilities should be considered within Veneta and at other locations with pedestrian activity.

### **Environmental**

- There are multiple potential conflicts with natural resources (including multiple plant and animal habitats) near the highway due to the proximity of the Fern Ridge Reservoir. However, the Fern Ridge Reservoir and other scenic and natural resources could be made into destinations for recreation, with improvements such as a bike path connection and turning wetland mitigation areas into recreational education areas.
- There is interest in balancing the needs of people versus the environment.

### **Freight Rail**

- The Strategy recommends supporting appropriate land use designations to provide increased freight rail access opportunities.

### **Motor Vehicle Capacity**

- The section between Veneta and Eugene is the most heavily congested on the corridor. Congestion could increase with employment growth in west Eugene and residential development in Veneta.

### **Refinement Planning**

- The Strategy recommends a refinement plan addressing safety and congestion for the segment from Veneta to Eugene to explore alternatives through a community consensus-building process. This section is of particular concern to residents of the Veneta area, many of whom commute regularly to the Eugene-Springfield metropolitan area for work, services, and other activities. Growing residential development pressures in Veneta and booming industrial and commercial development in west Eugene have heightened concerns about the future capacity of OR 126 for all travel modes. The highway has two lanes with minimal

shoulders. Expansion of the roadway is severely limited by environmental constraints. Some identified congestion and capacity improvements to consider include (1) widening the shoulders for bike lanes and emergency parking, (2) expanding the highway to four lanes, (3) paving K.R. Nielsen Road for use as an alternative route, (4) rerouting OR 126 around the Fern Ridge Reservoir, and (5) adding a reversible HOV lane between Veneta and Eugene.

***Florence-Eugene Highway Conditions Report***  
*2001, Oregon Department of Transportation*

This report provides information about the OR 126W corridor in an electronic format primarily using interactive maps. It contains a comprehensive data set that describes the current physical and operating conditions on OR 126W. It also provides a general forecast of future travel demand and an assessment of the ability of the existing highway to handle expected growth through 2025 under no-build conditions (i.e., if no improvements are made between now and then). Therefore, its intent is to pinpoint the geometric, operational, and safety deficiencies that are likely to occur if there is no investment in OR 126W, beyond those currently planned and programmed. Using the information in this report, ODOT and local partners will be able to define critical problems, analyze alternative improvement concepts, and develop recommended long-term solutions to the problems created by the deficiencies in the 126W corridor.

The study addresses the following issues (which are listed along with some specific information related to the corridor segment between Veneta and Eugene):

- Overview of related plans, policies, and studies
- Discussion of corridor significance and history
- Trends in population, employment, land use, and travel growth
  - Majority of traffic volume growth occurs between Veneta and Eugene
- Existing and forecast conditions for each of the eleven 126W study intersections analyzed and each mainline highway segment
  - Future congestion expected at all unsignalized intersections between Veneta and Eugene
- Environmental conditions
- Opportunities and recommendations for short-term improvements (i.e., those that could be made before the completion of a full alternatives analysis for the corridor)
  - Widen shoulders
  - Restripe roadway
  - Install advance intersection sign

This report is intended to help ODOT focus its planning efforts on the most significant problems and to act as a catalyst for further discussion about how best to invest in OR 126W. The next phase in planning for the future of 126W is to determine which transportation improvement alternatives will

best protect and improve travel conditions in the corridor. The second-phase was expected to take the form of a corridor plan or refinement plan involving the following basic steps:

- Evaluate the deficiencies identified in phase one
- Identify the problems that cause the deficiencies
- Identify alternatives to address the problems
- Evaluate the alternatives
- Develop solution recommendations

### ***TPAU Review of Florence-Eugene Highway Conditions Report***

*December 7, 2001, ODOT Transportation Planning Analysis Unit*

The ODOT Transportation Planning Analysis Unit (TPAU) performed a traffic analysis that was used in the preparation of the *2001 Florence-Eugene Highway Conditions Report*. The analysis was for 30<sup>th</sup> highest hour traffic volumes under the 2001 Existing and 2025 Future No-Build scenarios. The memorandum indicates that traffic characteristics for the section of OR 126 from Florence to Veneta was characterized as daily commuter traffic with a peak hour from 5:00 to 6:00 p.m. This finding was supported by the higher volume-to-capacity ratio at the OR 126/Territorial Highway intersection during the weekday p.m. peak hour versus the weekend recreational peak hour (both peak hours were analyzed for this intersection).

The future analysis indicated that in the 2025 No-Build scenario, both unsignalized intersections and the entire mainline between Veneta and Eugene fail to meet the 1999 OHP mobility standards. One potential improvement that would address congestion (though may have other undesirable impacts), would be to widen this section of the highway to four lanes. In addition, the Fisher Street and Central Road intersections with OR 126 are locations that may need turn lanes in the future due to safety and operational concerns. If turn lanes on OR 126 are provided in the future, then they should be sufficiently long to accommodate potential queues caused by gate down time at the adjacent railroad track. The Fisher Street intersection was also identified as a location that is expected to meet traffic signal warrants under the 2025 Future scenario.

### ***Oregon 126 Safety Study***

*April 8, 2005*

This study provides an analysis of highway safety on OR 126W between the western edge of the Eugene metro area and US 101 in Florence. The study identifies the types, causes, and severity of crashes given the current highway condition and daily traffic. One purpose of the study was to assess the impacts of future projected traffic as well as previously unanticipated casino traffic growth on the existing safety condition in the corridor. Study recommendations include safety mitigation priorities that encompass the range of alternatives including education, enforcement, and engineering options.

The study includes the following sections:

- Executive Summary (April 8, 2005)
- Safety Concern Spreadsheet
- Crash Analysis Report (July 2004)
- Law Enforcement/EMS Interviews (July 26, 2004)
- Casino Safety Impacts (October 25, 2004)
- Implementation Strategy/Conceptual Mitigation Alternatives (November 23, 2004)

Some of the specific findings and recommendations for the corridor segment between Veneta and Eugene include the following:

- Enforcement staff and EMS first responders would benefit from:
  - Turnarounds and launch pads
  - Roadway and/or shoulder widening
- Safety could be improved by installing:
  - Shoulder rumble strips where 4' shoulders are available
  - Edge and centerline raised pavement markers when permitted by ODOT (or other centerline demarcation to help reduce cross-over collisions)
- The segment between Milepoints 49.00 to 49.49 (near Fern Ridge Reservoir) is a two lane roadway with guardrail that protects drivers from water (wetlands) on each side of the roadway. This segment was examined in greater detail due to higher occurrence of crash severity and frequency. The analysis indicated that this segment:
  - Has a long straight section with intersection at MP 49 not clearly defined with decreased sight visibility due to location and placement of guardrail
  - Needs improved visibility or audible for improved recognition of intersection
- A major contributing factor to crash potential appears to be the diverse mix of corridor users that includes everything from log trucks to recreational travelers heading to and from the coast. Accordingly, raising the awareness of all drivers to the need to drive safely is expected to produce the most beneficial and observable results

### ***West 11<sup>th</sup> Avenue Corridor Study***

*July 2010, DKS Associates for the City of Eugene*

A study of the West 11<sup>th</sup> Avenue corridor (which transitions into OR 126 as it heads west and leaves the Eugene UGB) was completed for the City of Eugene in 2010. The purpose of the study was to identify short-term strategies to improve bicycle and pedestrian facilities, corridor safety, access, signal timing, and traffic operations. The corridor study area spanned from Green Hill Road on the west to Chambers Street on the east.

The only overlap of the *West 11<sup>th</sup> Avenue Corridor Study* with the current OR 126W Fern Ridge Corridor Plan is near the Green Hill Road intersection (both studies include this as a study intersection). The *West 11<sup>th</sup> Avenue Corridor Study* identified the need to either upgrade West 11<sup>th</sup> Avenue to a five-lane urban arterial or construct a dual-lane roundabout at the West 11<sup>th</sup> Avenue

(OR 126W)/Green Hill Road intersection (though this improvement was not one of the four improvements identified as highest priority for ODOT and the City of Eugene).

The study also identified the need to provide an improved bicycle connection between Ed Cone Boulevard (which has bike lanes and connects to the Fern Ridge Path) and Crow Road (which is a major cycling route). Any bicycle facility improvements on OR 126 should consider how best to connect to the Fern Ridge Path in this vicinity.

### ***A New Vision for West Eugene***

*March 2009, West Eugene Collaborative*

The West Eugene Collaborative (WEC) formed in early 2007 with the aid of the Oregon Consensus Program. It is an ad hoc group encompassing a broad variety of viewpoints, including political and governmental leaders, business leaders, leaders of neighborhood groups, leaders of nonprofit organizations, and leaders within the environmental community. The WEC's purpose is to "develop an integrated land use and transportation solution, supported by stakeholders, that will facilitate movement of people and commerce from/through/to west Eugene and west of Eugene while enhancing community, business, and the environment."

This report documents analysis and recommendations that cover a large area of interest that extends as far west as Veneta. It is intended to be viewed as a general course that seems to have potential for addressing concerns in the west Eugene area. One of the recommendations was to complete a safety and mobility study for OR 126. All recommendations are intended to promote further public input, discussion, and consideration. Therefore, the WEC recommends efficient and transparent public planning, local community outreach and relationship building, and continued collaboration among all agencies and stakeholders.

### ***City of Veneta Comprehensive Plan (Ordinance 416)***

*Adopted September 25, 2000; most recently amended November 23, 2009*

The comprehensive Plan serves as Veneta's long-range land use plan and as a policy guide to physical development decisions. It consists of the following eleven plan elements:

- Growth Management
- Community, Building, and Site Design
- Residential Land and Housing
- Economic Development
- Utilities
- Community Facilities and Services
- Transportation
- Parks and Open Space
- Natural Resources
- Air, Water, and Land Resource Quality
- Areas Subject to Development Constraints

The Transportation element (pages 47 to 56) of the Veneta Comprehensive Plan provides goals and policies to guide the development of the TSP and to monitor future transportation strategies and improvements. These goals and policies address quality of life, congestion, connectivity, access, multi-modal mobility, environmental impact, coordination, design standards, and other issues.

***Veneta Transportation System Plan (Ordinances 401, 427, 432, and 464)***  
*Adopted November 9, 1998; most recently amended April 24, 2006*

Veneta adopted their first TSP in 1998. This plan has been amended by ordinance three times (in 2001, 2002, and 2006). The TSP is the long-range policy document that guides transportation planning within the Veneta Urban Growth Boundary (UGB) for the next 20 years. The plan assumes that the city will grow from its population of approximately 2,850 residents in 1996 (and 480 jobs in 1994) to approximately 5,450 residents and 840 jobs by the year 2015 (between 4% and 5% yearly growth). The plan was written by Lane Council of Governments and funded by ODOT and the City of Veneta. The TSP chapters include:

- Chapter 1: Introduction
- Chapter 2: Mission, Goals, and Policies
- Chapter 3: Modal Plans
- Chapter 4: Implementation Actions
- Chapter 5: Financing Strategies

**Key Issues Applicable to OR 126 Study Area Corridor**

The issues raised in the TSP that are applicable to the OR 126 study area corridor include:

**Traffic Control and Access**

- Traffic control (i.e. signing, striping, etc.) is not adequate to control flow of traffic
- Only one signal (Territorial Road intersection)
- Huston Road provides one additional access point which could be used to divert some of the traffic through connectivity with other streets; directing traffic to Huston Road may increase need for additional signal
- Ingress/egress standards need to be fair for all access/users
- Alternate access needed for emergency vehicles
- Recommendation: Additional Traffic Signal(s) on Hwy 126

**Traffic Congestion**

- Only route to the coast from Eugene
- Congestion of a wide variety of vehicle types on road; i.e. commercial, recreational, commuter
- Road capacity is not adequate, nor has it been for 25 years
- Future traffic on highway likely to increase
- Recommendation: Widen Highway to 4 lanes

**Safety**

- Frequent accidents at major intersections
- Difficult to access Hwy 126 from side streets during peak traffic hours

**Speed**

- Speed limits are too high between Ellmaker and West Lane Center
- More traffic enforcement is needed
- Conflict between speeds driven by highway travelers and business customers. Ingress and egress for businesses is hazardous
- Greater speed reduction zone near traffic signal is needed

**Projects along OR 126 Study Area Corridor**

The projects identified in the TSP for the OR 126 study area corridor include:

- **Project B6 (Safe Pedestrian and Bicycle Crossing of OR 126, shared responsibility between ODOT and City of Veneta):** The best location for a grade separated crossing improvement is most likely west of Huston Road (i.e., near Hope Lane). However, crossing improvements, such as median refuge islands and other treatments may be beneficial in the study corridor.
- **Project B8 (Traffic Signal at OR 126/Huston Road Intersection, shared responsibility between ODOT and City of Veneta, Cost Estimate = \$5 million):** The TSP reported that Huston Road was not meeting signal warrants at the time of the TSP preparation. Once the intersection meets warrants (based on a future traffic study: Study D-4), then a signal should be constructed. The proximity of the railroad crossing south of the intersection will affect improvement design and costs.
- **Project B14 (Off-Street Paths, responsibility of City of Veneta, Cost Estimate = \$500,000):** Construct paths for bicyclists and pedestrians along the drainage-ways within the area already designated open space/greenway in the Comprehensive Plan. The cost estimate does not include right-of-way or easement acquisition.

***City of Veneta Land Development (Ordinance 493)***

*Adopted January 25, 2010*

Article 5 provides land development supplementary provisions, including the following transportation-related sections:

- SECTION 522: Pedestrian Access and Circulation (page 115)
- SECTION 523: Transit Facilities (page 116)
- SECTION 524: Access Management (page 117)
- SECTION 527: Traffic Impact Analysis and Mitigation (page 122)
- SECTION 528: Street Trees (page 123)

### ***Fern Ridge Trail System: Visions and Strategies***

*July 2007*

The Fern Ridge Trail System visioning document is a long range vision and conceptual tool that provides general insight in the following areas:

- Establishing the need for the proposed trail system
- Potential trail location and opportunities identification (descriptions, table, and map)
- Factors that influenced mapping and project prioritization
- Funding strategies (includes trial project grant schedule)
- Community input (group meetings, open house, and questionnaires)

This preliminary planning process was intended to raise awareness about the vision, to create a conceptual framework that helps facilitate the development of partnerships, and to place the City of Veneta in a better position to obtain grant funding and other forms of assistance as opportunities arise. It is a starting point to explore the feasibility of the individual projects and trail segments identified in the vision. The map of proposed routes is intended to be refined and adjusted based on additional planning and implementation efforts. Some additional efforts that are needed prior to implementing individual trail projects include a more detailed analysis of such issues as engineering, cost, funding, and environmental, social, and economic impacts.

### ***Eugene-Springfield Metropolitan Area General Plan (Metro Plan)***

*2004 Update*

The *Eugene-Springfield Metropolitan Area General Plan*, also known as the *Metro Plan* is an overarching guidance document and functions as a framework for supplemental documents to provide more detailed programs, plans, and policies for the metropolitan area of Lane County and the cities of Eugene and Springfield. The *Metro Plan* is a long-range planning document that establishes and the goals and policies to guide land use. Land use encompasses growth, development, redevelopment and conservation of resources. The *Metro plan* includes a transportation element; however it does not provide location-specific recommendations.

### ***TransPlan: Eugene-Springfield Transportation System Plan***

*July 2002*

The Eugene-Springfield Transportation System Plan (TSP), also known as *TransPlan*, contains transportation goals, policies, and strategies to address transportation needs for the Eugene-Springfield metropolitan area through the year 2021. The *TransPlan* theme was “Improving Our Transportation Choices” which reflects the plan’s focus to provide a variety of transportation modes and smooth connections between those modes.

*TransPlan* has developed a Capital Investment Action Project List. The list includes both Financially Constrained 20-year Capital Investment Actions and Future (Beyond 20 Years) 20-Year Capital Investment Actions. The constrained projects are then subdivided into Programmed projects which are expected to have a 0-5 year implementation horizon that have funding sources identified and

un-programmed projects that do not have specific funding identified but are expected to be funded within the 20-year planning future. The *TransPlan* Financially Constrained 20-Year Capital Investment Action project lists were adopted and incorporated by amendment into the *Metro Plan*. They are also the same projects identified in the *Central Lane MPO Regional Transportation Plan*. There are some differences, but the *Central Lane MPO Regional Transportation Plan* is more up-to-date.

### ***Central Lane MPO Regional Transportation Plan***

*November 2007, Lane Council of Governments*

The Central Lane Metropolitan Planning Organization (MPO) Regional Transportation Plan (RTP) guides regional transportation system planning and development in the CLMPO metropolitan area. The RTP includes provisions for meeting the transportation demand of residents over a 20-year planning horizon (2031) while addressing transportation issues and making changes that can contribute to improvements in the region's quality of life and economic vitality represents a required update to the federal RTP.

The RTP is adopted by the Metropolitan Policy Committee (MPC) and is required to be updated every four years (i.e., the next update is anticipated for 2011). The ongoing nature of regional transportation planning allows the RTP to be a dynamic plan of action for the future transportation system, rather than a static snapshot in time. The RTP is particularly important for guiding transportation public policy and investment decision making over the three- to five-year period following plan adoption, until the next plan update.

The RTP establishes the framework upon which the region's public agencies can make consistent and coordinated planning decisions regarding inter- and intra-jurisdictional transportation. The regional planning process ensures that the planning activities and investments of the local jurisdictions are coordinated in terms of intent, timing, and effect. The RTP sets forth the long-range policy framework for decision making for the following elements of the region's multi-modal transportation system:

- Regional roadways
- Regional transit system
- Regional bikeways and pedestrian circulation
- Regional goods movement (multiple modes)
- Regional aspects of other modes, including air, rail, and inter-city bus service

Implementation actions also accompany the policy element as a core component of the RTP. The RTP Policy Framework (Chapter Two) and Implementation Actions (Chapter Three) are structured around three fundamental components of transportation planning:

- Land use
- Transportation demand management
- Transportation system improvements

The RTP Policy Framework (Chapter Two) includes goals, objectives, and policies.

- **Goal:** Broad statement of philosophy that describes the hopes of the people of the community for the future of the community. A goal may never be completely attainable but it is used as a point towards which to strive.
- **Objective:** An attainable target that the community attempts to reach in striving to meet a goal. An objective may also be considered as an intermediate point that will help fulfill the overall goal.
- **Policy:** Statement adopted as part of *TransPlan* to provide a consistent course of action, moving the community towards attainment of its goals

### **Projects Applicable to OR 126 Project Study Area**

The Central Lane MPO boundary covers Eugene, Springfield, Coburg, and some adjacent surrounding areas. On the west, its boundary extends just west of Green Hill Road. Therefore, only a small portion of the study area is within the MPO boundary (in the MPO's Geographic District 4). The following projects were identified in the plan:

#### **RTP Table 1a-Financially Constrained – Capital Investment Actions: Roadway Projects**

- **Project 333. West 11th Avenue (Green Hill Road to Terry Street):** Upgrade to 5-lane urban facility; ODOT and Eugene; \$20,000,000; 1.51 miles; includes striped bike lane
- **Project 485. Green Hill Road (Airport Road to Barger Drive):** Rural widening and intersection modifications; Lane County; \$2,800,000; 1.98 miles; includes striped bike lane

#### **RTP Table 3a-Financially Constrained – Capital Investment Actions: Bicycle Projects**

- **Project 453. Green Hill Road (West 11th Avenue to Crow Road):** Striped bike lane/shoulder; Lane County; \$250,000; 0.26 miles;

#### **RTP Table 3b-Illustrative – Capital Investment Actions: Bicycle Projects**

- **Project 426. Fern Ridge Path #3 (Royal Avenue to Fern Ridge Reservoir):** Multi-use path; Eugene and Lane County; \$6,891,000; 0.91 miles;

### ***Central Lane MPO Unified Planning Work Program (FY 2012 and 2013)*** ***May 2011 (Covering July 1, 2011 to June 30, 2013)***

The Unified Planning Work Program (UPWP) is a federally required certification document describing the transportation planning activities to be undertaken in the Central Lane metropolitan area for a specific fiscal year or years. Development of the UPWP provides local agencies with an opportunity to identify transportation needs, objectives, and products.

This document identifies the "Oregon 126: Veneta-Eugene Facility Plan" as one of the Major Facility Studies (LCOG Action Item #5). This study will be conducted in partnership with ODOT, the City of Eugene, and Lane County. The document states the following about the plan:

- **Project Description:** The Oregon 126W corridor, from Veneta to Eugene, is primarily a two-lane highway with capacity and environmental constraints. Since 1998, three reports discuss existing conditions and interim safety improvements to the highway. No long-term improvement plan to address capacity, safety, or operations issues exists. This project is a planning-level analysis for the Oregon 126 corridor, specifically from Veneta to Eugene. The analysis will precede a future National Environmental Policy Act (NEPA) process and will reduce the costs during that process by completing a high-level alternatives analysis for the facility. This planning-level analysis will examine existing reports, existing highway conditions, future 'no-build' conditions, and opportunities and constraints. A variety of long-term solutions, including identification of alternate routes, highway capacity improvements, and/or a combination of solutions to address safety and operations will also be analyzed. The analysis will identify any fatal flaws of alternatives considered and recommend solutions to forward for more detailed examination during the future NEPA process.
- **Lead Agency:** ODOT
- **Partner Agencies:** City of Eugene Lane County, LTD, and LCOG
- **Current Status:** Project start-up
- **Estimated Completion:** 2013
- **Estimated Project Cost:** \$500,000

### ***2010 Federal Priorities: United Front Partners of Lane County, Oregon***

This document was presented to the Oregon Congressional Delegation and identified the federal priorities of the United Front partners in Lane County for fiscal year 2011. One of the priorities was obtaining funding for the *Highway 126W/Green Hill Rd to Veneta Corridor Study (Lane County)*. The specified intent of the project was to perform initial planning and NEPA Study work to begin the process to identify problems and potential solutions for the Highway 126 West (OR 126) corridor extending from Green Hill Road on the western boundary of the Eugene-Springfield urban growth area to the City of Veneta. Detailed background information and a project description are provided for the project.

### ***Lane County Rural Comprehensive Plan***

*Updated January 2005*

The Lane County Rural Comprehensive Plan applies to all unincorporated lands within the County beyond the Urban Growth Boundaries of incorporated cities in the County and beyond the boundary of the Eugene-Springfield Metropolitan Area Plan. It includes general County planning policies that provide broad direction and interpretation of approaches for County planning needs and complying with State of Oregon planning law.

Goal 12 of the plan addresses transportation. It includes policies directed at providing a coordinated, balanced, efficient, safe, and attractive transportation system.

## ***Lane County Transportation System Plan***

*May 5, 2004*

The Lane County Transportation System Plan (TSP) is a 20-year planning document that provides greater clarity for planning and managing the County transportation system in terms of coordination with new development, targeted transportation improvements, fiscal management, and cooperation with local and state agencies on transportation issues. The TSP fulfills state requirements in accordance with OAR 660-012. The applicable area of Figure 5c from the TSP is provided below and shows the proposed projects in the vicinity of the OR 126 Project Study Area. Most projects are rural modernization or upgrading to urban standards. There are also some bicycle and pedestrian projects near Veneta.

## ***Lane Code: Ch. 16 (Rural Comprehensive Plan and Rural Zoning) and Ch. 10 (Zoning)***

The Lane Code includes transportation-related code information in Chapter 16 (Rural Comprehensive Plan and Rural Zoning) and Chapter 10 (Zoning). Chapter 16 provides for allowable rural transportation uses and development outside of urban growth boundaries, while Chapter 10 provides for transportation uses and development inside urban growth boundaries and outside of city limits. Lane County delegated authority to Eugene (and Springfield) to regulate zoning inside Eugene's (and Springfield's) urban growth boundaries.

## ***Oregon Transportation Plan***

*Adopted September 20, 2006*

The Oregon Transportation Plan (OTP) is a comprehensive plan that addresses the future transportation needs of the State of Oregon through the year 2030. It considers all modes of transportation, including airports, bicycle and pedestrian facilities, highways and roadways, pipelines, ports and waterway facilities, public transportation, and railroads.

Seven goals with associated policies and strategies are provided in the plan to address the core challenges and opportunities facing transportation in Oregon. The seven goals are:

- **Goal 1 – Mobility and Accessibility:** To enhance Oregon’s quality of life and economic vitality by providing a balanced, efficient, cost-effective and integrated multimodal transportation system that ensures appropriate access to all areas of the state, the nation and the world, with connectivity among modes and places.
- **Goal 2 – Management of the System:** To improve the efficiency of the transportation system by optimizing the existing transportation infrastructure capacity with improved operations and management.
- **Goal 3 – Economic Vitality:** To promote the expansion and diversification of Oregon’s economy through the efficient and effective movement of people, goods, services and information in a safe, energy efficient and environmentally sound manner.
- **Goal 4 – Sustainability:** To provide a transportation system that meets present needs without compromising the ability of future generations to meet their needs from the joint perspective of environmental, economic and community objectives. This system is consistent with, yet recognizes differences in, local and regional land use and economic development plans. It is efficient and offers choices among transportation modes. It distributes benefits and burdens fairly and is operated, maintained and improved to be sensitive to both the natural and built environments.
- **Goal 5 – Safety and Security:** To plan, build, operate and maintain the transportation system so that it is safe and secure.
- **Goal 6 – Funding the Transportation System:** To create a transportation funding structure that will support a viable transportation system to achieve state and local goals today and in the future.
- **Goal 7 – Coordination, Communication and Cooperation:** To pursue coordination, communication and cooperation among transportation users, providers and those most affected by transportation activities to align interests, remove barriers and bring innovative solutions so the transportation system functions as one system.

There are also six key initiatives identified to reflect the desired direction of the plan and to frame the plan implementation. These initiatives are:

- Maintain the existing transportation system to maximize the value of the assets. If funds are not available to maintain the system, develop a triage method for investing available funds.

- Optimize system capacity and safety through information technology and other methods.
- Integrate transportation, land use, economic development and the environment.
- Integrate the transportation system across jurisdictions, ownerships and modes.
- Create a sustainable funding plan for Oregon transportation.
- Invest strategically in capacity enhancements.

The Implementation Framework section of the OTP also describes the implementation process and how state multimodal, modal/topic plans, regional and local transportation system plans, and facility plans will refine the OTP's broad policies and investment levels. The OR 126 corridor plan is a facility plan. The State Agency Coordination Program defines a facility plan as: "a plan for individual transportation facilities that includes identification of needs for using the facility, an overall plan for improving the system and policies for operating the facility." Facility plans must be adopted by the Oregon Transportation Commission (OTC), and must be developed with public involvement and implement the OTP and the applicable modal/topic plan goals, policies, implementation strategies, and broad investment scenarios.

The OTP also includes the following elements that affect OR 126 and that were also reviewed as part of this Background Document Review memorandum:

- Bicycle and Pedestrian Plan (Adopted 1995)
- Highway Plan (Adopted 1999, Reaffirmed 2006)
- Oregon Public Transportation Plan (Adopted 1997)
- ODOT Rail Plan (Adopted 2001)

### ***Oregon Bicycle and Pedestrian Plan***

*Adopted 1995, Included in September 2006 Oregon Transportation Plan*

The Oregon Bicycle and Pedestrian Plan is an element of the Oregon Transportation Plan (OTP), which was most recently adopted in September 2006. The goal of the plan is to provide safe and accessible bicycling and walking facilities in an effort to encourage increased levels of bicycling and walking. The plan provides actions that will assist local jurisdictions in understanding the principals and policies that ODOT follows in providing bike and walkways along state highways. In order to reach the plan's objectives, the strategies for system design are outlined, including:

- Providing bikeway and walkway systems and integrating with other transportation systems.
- Providing a safe and accessible biking and walking environment.
- Developing educational programs that improve bicycle and pedestrian safety.

Specific information pertaining to *Bike & Walkway Planning Design, Maintenance & Safety* can be found in Section 2 of the *ODOT Bike and Pedestrian Plan*. Guidance is given for walkway design, street crossings, and intersection pedestrian crossings. Additional guidance is also given for bicycle facility design. In addition, the Policy and Action section contains background information, legal mandates and current conditions, goals, actions and implementation strategies ODOT proposes to improve bicycle and pedestrian transportation.

### **1999 Oregon Highway Plan (OHP)**

*August 2006 Version (Includes Amendments Nov. 1999 through Jan. 2006)*

The basic framework for the *1999 Oregon Highway Plan (OHP)* is a refinement and application of the goals and policies stated in the Oregon Transportation Plan to the state highway system. The OHP gives policy and investment direction to large scale plans (such as the OR 126 Facilities Plan), but is not intended to direct specific projects and modal alternatives.

One of the key goals of the OHP is to maintain and improve safe and efficient movement of people and goods, while supporting statewide, regional, and local economic growth and community livability. The implementation of this goal occurs through a number of policies and actions that guide management and investment decisions by defining a classification system for state highways, setting standards for mobility, employing access management techniques, supporting intermodal connections, encouraging public and private partnerships, addressing the relationship between the highway and land development patterns, and recognizing the responsibility to maintain and enhance environmental and scenic resources.

Specific OHP policies with bearing on the OR 126 Facilities Plan include the following:

#### **Policy 1A – State Highway Classification System**

- The OR 126 project study area corridor is classified as a Statewide Highway. It is also part of the National Highway System (NHS), is a State Freight Route (FR), and is a Federally Designated Truck Route (TR). The eastern section of the corridor is part of the Beltline Highway (Highway #569), and the western section is part of the Florence-Eugene Highway (Highway #62).

#### **Policy 1B: Land Use and Transportation**

- Land use and transportation planning and development should be coordinated between state, regional, county, and city agencies. Key elements of this policy indicate that the State of Oregon and local agencies should:
  - Work together to provide safe and efficient roads for livability and economic viability for all citizens
  - Work collaboratively in planning and decision-making related to transportation system management
  - Maintain the mobility and safety of the highway system
  - Encourage the availability and use of transportation alternatives

#### **Policy 1C: State Highway Freight System**

- OR 126 has been designated a Freight Route by ODOT, which places added emphasis on efficient operation to ensure the timely and dependable movement of goods. To support this function, special management objectives for freight routes were developed as outlined in Policy 1C of the OHP. Key objectives relating to this plan include:
  - Application of higher highway mobility standards than other Statewide Highways;

- o Examine options to treat designated freight routes as expressways where the routes are outside of urban growth boundaries and unincorporated communities and continue to treat freight routes as expressways within urban growth boundaries where existing facilities are limited access or where corridor or transportation system plans indicate limited access
- o Consider the importance of timeliness in freight movements in developing and implementing plans and projects.

**Policy 1F: Highway Mobility Standards**

- ODOT has adopted standards for mobility for state facilities through the OHP and the *Highway Design Manual* (HDM). Standards contained in the OHP are used for planning purposes to identify deficiencies, while facilities and improvements are designed to HDM standards.
- The OHP Highway mobility standards are based on various factors, including highway classification and designations, whether it is within a metropolitan planning organization (MPO) or urban growth boundary (UGB), and the posted speed. The section of OR 126 being studied is a Statewide Highway designated as both a truck route and freight route. The Green Hill Road intersection is within the Central Lane MPO, and the Huston Road intersection is within the Veneta UGB. The speed limit along the entire study corridor is posted at 55 mph. Table 6 from the OHP indicates the applicable mobility standards based on the location and posted speed of a given highway segment. The entries of Table 6 that are applicable to the study corridor are provided in the following table.

**ODOT Mobility Standards<sup>a</sup> Applicable for OR 126 (from OHP Table 6)**

| Highway Category                                  | Inside Eugene UGB                   | Inside Veneta UGB               | Outside UGB             |
|---------------------------------------------------|-------------------------------------|---------------------------------|-------------------------|
|                                                   | <i>Inside Central Lane MPO</i>      | <i>≥45 mph posted speed</i>     | <i>Rural Lands</i>      |
| Freight Route on a Statewide Highway <sup>b</sup> | 0.80 (Green Hill Road intersection) | 0.70 (Huston Road intersection) | 0.70 (Rest of Corridor) |
| Stop-controlled side streets <sup>c</sup>         | 0.90                                | 0.80                            | 0.80                    |

<sup>a</sup> ODOT operating standards obtained from August 2005 version of Table 6 in OHP.

<sup>b</sup> At signalized intersections, these standards are to be applied to the intersection as a whole. At unsignalized intersections, these standards are applicable only to movements that are not required to stop.

<sup>c</sup> For movements at unsignalized intersections that are required to stop or otherwise yield the right of way, the standards for District/Local Interest Roads shall be applied for areas within urban growth boundaries and a maximum v/c ratio of 0.80 shall be applied for areas outside of urban growth boundaries.

**Policy 1G: Major Improvements**

- According to this policy, the highest priority should be placed on protection of the existing system, followed by improvements in efficiency and capacity of existing facilities. Once these options have been investigated, the third and fourth priorities would be to add capacity to the existing system and then to add new facilities.

**Policy 2A: Partnerships**

- The limited resources available for transportation planning and development should be efficiently and effectively used by coordinating the efforts of all agencies. For the project corridor, the applicable agencies include the City of Veneta, the City of Eugene, Lane County, and ODOT.

**Policy 2B: Off-System Improvements**

- The State is to provide financial assistance for local road projects when the projects are cost-effective in improving state facility conditions.

**Policy 2D: Public Involvement**

- The City should offer opportunities for effective public involvement in transportation planning and project development.

**Policy 2F: Traffic Safety**

- Increase the safety of the state transportation system through engineering, education, enforcement, and emergency medical services. Key elements from this policy include:
  - In identifying solutions to traffic safety problems, consider solutions including but not limited to: Increasing traffic enforcement; Involving business and community groups and the media in educational efforts; using educational materials and special signing to change driving practices; making engineering improvements such as geometrics, signing, lighting, striping, signals, improving sight distance, and assessing conditions to establish appropriate speed; constructing appropriate bicycle and pedestrian facilities including safe and convenient crossings; managing access to the highway; developing incident response and motorist assistance programs; ensuring the uniformity of traffic control devices; and developing driver information systems.
  - Continue to develop and implement the State's Safety Management System to target resources to sites and routes with the most significant safety problems. Encourage local governments to adopt a safety management system.
  - Work with citizens and local jurisdictions to address safety concerns on the state highway system.

**Policy 3A: Classification and Spacing Standards**

- Access to state highways should be managed to assure safe and efficient operations consistent with the classification system outlined in Policy 1A. Access considerations include the location, spacing, and type of access (i.e., public versus private). Access spacing standards and management objectives for OR 126 are based on its designation as a Statewide Highway (NHS) and Non-Expressway (i.e., Rural Other):
  - Statewide Rural Highways provide for high speed, continuous flow and through traffic movement.
  - Direct access to the abutting property is a minor objective.

- o The function of the highway is consistent with purchasing access rights. As the opportunity arises, access rights should be purchased. Preference is to purchase access rights in full.
- o The primary function of these highways is to provide connections to larger urban areas, ports and major recreation areas of the state not served by Freeways or Expressways.

**Policy 3B: Medians**

- Policy 3B in the OHP addresses the installation of non-traversable medians in state highways. According to this policy, the installation of non-traversable medians shall be considered for (only potentially applicable conditions for OR 126 are listed):
  - o Highways not undergoing modernization where a median could improve safety;
  - o Highways where forecasted average daily traffic is anticipated to be 28,000 vehicles per day during the 20-year planning period
  - o The annual accident rate is greater than the statewide average accident rate for similar roadways
  - o Pedestrians are unable to safely cross the highway, as demonstrated by an accident rate that is greater than the statewide annual average accident rate for similar roadways
  - o Topography and horizontal or vertical alignment result in inadequate left-turn intersection sight distance and it is impractical to relocate or reconstruct the connecting approach road or highway to improve the situation

Goal 3 (Access Management) is critical in transportation planning efforts that involve state transportation facilities. This goal is implemented through OAR 734-051, which is reviewed later in this Background Document Review Memorandum. Goal 4 (Travel Alternatives) and Goal 5 (Environmental and Scenic Resources) also apply, if in limited ways. Goal 5, with an aim to go beyond what is required by other state and federal regulations, calls for natural resources to be maintained and even improved by transportation planning and projects involving state facilities.

***Oregon Public Transportation Plan***  
***Adopted 1997***

The transit modal plan, called the Oregon Public Transportation Plan (OPTP), develops the Oregon Transportation Plan (OTP) goals and objectives related to the public transportation system, including public transit, special needs transportation, transportation options and intercity bus. Public Transit Division's programs are designed to implement the OPTP. The OPTP was adopted in 1997, and is scheduled to be updated beginning in 2011-2013.

### ***ODOT Rail Plan***

*Adopted 2001, Included in September 2006 Oregon Transportation Plan*

The Oregon Rail Plan is a comprehensive assessment of the state's rail planning, freight rail, and passenger rail systems (not including light rail or other rail transit type services). It documents and describes various federal and state rail planning requirements and highlights specific goals and policies. It also reviews the development of the state freight and passenger rail systems and identifies needed improvements. Particular emphasis is placed on safety, public and private coordination, efficiency, and multi-modal integration. Segments of the plan that are expected to be the most relevant to the OR 126 Facilities Plan are referenced below (and should be referred to as needed throughout the planning process):

- **Rail Division Involvement:** Whenever any road work (including construction of a sidewalk) is proposed within 500 feet of a railroad track, the party responsible for the project should consult ODOT Rail Division. A checklist guiding ODOT Rail is provided on pages 23-24.
- **New Crossing Construction:** Related information is provided on page 24.
- **Alteration of Existing Public Crossings:** Related information is provided on page 24.
- **Improving Safety:** Safety is the most important conflict to mitigate in most urban areas. There are a variety of ways to improve safety at grade crossings that may be applied individually or in combination. These alternatives are identified on pages 31-32.
- **Minimizing Conflict and Increasing Access:** Careful planning can mitigate conflict and improve access. Recommendations for local jurisdictions are provided on page 33.

### ***Draft Oregon Freight Plan***

*December 15, 2010 (most recent draft)*

The *Oregon Freight Plan (OFP)* is currently in draft form and has not yet been adopted. Its purpose will be to improve freight connections to local, state, regional, national and global markets in order to increase trade-related jobs and income for Oregon workers and businesses. It will provide a roadmap for the Oregon Department of Transportation (ODOT), other state and local agencies, and the private sector to work together to preserve and enhance the State's freight system.

### ***Oregon State Rail System Maps***

The railroad that runs parallel to OR 126 is identified on the Oregon State Rail System maps as an Oregon Short Line. There is no passenger rail that uses this track, but OR 126 is identified as an Intercity Bus Route as well as an Interline Thruway Bus Route.

### ***2009 ODOT Traffic Manual***

The ODOT Traffic Manual is a comprehensive reference for traffic engineering practices published by the Traffic Engineering and Operations Section. This manual covers recommended practices for use on state facilities in the areas of access management, bicycle treatments, capacity analysis,

crash analysis, crosswalks, illumination, signing, pavement markings, parking, sight distance, speed zones, traffic calming, turn lanes, u-turns, and other topics.

### ***Oregon Statewide Transportation Improvement Program (STIP)***

*2010 – 2013 STIP and 2012 – 2015 Draft STIP*

The current adopted (2010-2013) Statewide Transportation Improvement Program (STIP) serves as ODOT's short term capital improvement program and provides funding and scheduling information for transportation projects for both ODOT and the metropolitan planning organizations in the state. Projects funded in the STIP reflect and advance the Oregon Transportation Plan for highways, public transportation, and for freight, passenger rail, bicycle, and pedestrian facilities. No projects on the OR 126 study area roadway were identified within the adopted 2010-2013 STIP or the draft 2012-2015 STIP.

### ***ODOT Safety Priority Index System (SPIS)***

*Prepared in 2010 using data from 2007 to 2009*

The Safety Priority Index System (SPIS) is a method developed by ODOT for identifying potential safety problems on state highways. SPIS scores are developed based upon crash frequency, severity, and rate. A prioritized list is created for each region (the top 10 percent of statewide SPIS sites) and the top five percent are investigated by the five Region Traffic manager's offices. There are not locations on the OR 126 study corridor within either the top five or top 10 percent, but the Green Hill Road intersection is in the top 15 percent of statewide SPIS sites.

In addition to the SPIS, the Safety Investment Program (SIP) is a tool used to identify accident history in 0.10 mile or variable length segments on state highways. The OR 126 study corridor has a Category 3 SIP rating because from 2007 to 2009 it had three to five fatal or serious injury crashes per 5 mile segment.

### ***Oregon Access Management Rule (OAR 734-051)***

The purpose of Oregon's Access Management Rule is to control the issuing of permits for access to state highways, state highway rights of way, and other properties under the State's jurisdiction. In addition, the ability to close existing approaches, set spacing standards, and establish a formal appeals process in relation to access issues is also identified.

These rules enable the State to set policy and direct location and spacing of intersections and approaches on state highways, ensuring the relevance of the functional classification system and preserving the efficient operation of state routes. Regulating access can:

- Protect resource lands
- Preserve highway capacity
- Ensure safety for segments of state routes with sharp curves, steep grades, or obstructed sight distance.

The access management standards adopted by ODOT and applicable to the OR 126 project study corridor are summarized in the table below.

**Applicable ODOT Access Management Standards (from 1999 OHP, Appendix C, Table 14)**

| Highway Category <sup>a</sup> | Spacing Standards <sup>b</sup> (by Posted Speed) |           |           |          |
|-------------------------------|--------------------------------------------------|-----------|-----------|----------|
|                               | ≥55 mph                                          | 40,45 mph | 30,35 mph | ≤25 mph  |
| Statewide Highway (urban)     | 1,320 feet                                       | 990 feet  | 720 feet  | 520 feet |
| Statewide Highway (rural)     | 1,320 feet                                       | 990 feet  | 770 feet  | 550 feet |

<sup>a</sup> OR 126 is classified by ODOT as a Statewide Highway.

<sup>b</sup> Measurement of the approach road spacing is from center to center on the same side of the roadway.

Source: 1999 Oregon Highway Plan, Appendix C, Table 14

ODOT applies the urban access standards for OR 126 within the Eugene and Veneta UGBs and the rural standards elsewhere. Any new street or driveway connections, as well as any changes to existing street or driveway connections, on OR 126 must be found to be in compliance with these rules by ODOT.

The 2011 Oregon Legislature passed SB 264 which will result in significant changes in how ODOT manages access to state highways. Some of the proposed changes will be incorporated into statute and will go into effect immediately. ODOT is also directed to make changes to OAR 734-51 to implement provisions of the bill.

### **2003 ODOT Highway Design Manual and Amendments**

*2003, with revisions in 2004 and 2005-2006*

The *ODOT Highway Design Manual* (HDM) contains standards for the design of state highways and various highway elements. Included in the manual are elements to be considered for evaluating the feasibility of construction and determination of right of way needs such as the general alignments, roadway widths, and criteria for installation of turn lanes. In addition, the HDM should be used to identify areas where design exceptions may be required.

The HDM displays the maximum allowable volume to capacity ratios for the 30<sup>th</sup> highest annual hour of traffic for use in the design of highway projects. These standards are to be applied to conditions forecasted to exist 20 years after completion of the proposed improvement. If the applicable mobility standard cannot be met, a design exception would be required. Mobility standards from the HDM applicable to the study area are presented in the following table.

**Applicable Highway Design Manual 20 Year Design-Mobility Standards (v/c ratios)**

| Highway Category                 | Inside Eugene UGB                      | Inside Veneta UGB                  | Outside UGB             |
|----------------------------------|----------------------------------------|------------------------------------|-------------------------|
|                                  | <i>Inside Central Lane MPO</i>         | <i>≥45 mph posted speed</i>        | <i>Rural Lands</i>      |
| Statewide (NHS)<br>Freight Route | 0.75 (Green Hill Road<br>intersection) | 0.70 (Huston Road<br>intersection) | 0.60 (Rest of Corridor) |

<sup>a</sup> ODOT operating standards obtained from 2003 HDM, Table 10-1.

**ODOT Practical Design Strategy**

*March 1, 2010, ODOT Highway Division*

Practical Design is a relatively new term used to define and improve current best practices for developing cost-effective transportation solutions that are the right projects, at the right time, at the right cost, and in the right way. It is a strategy that delivers focused benefits for the State's transportation system while working with the realities of a fiscally constrained funding environment. It focuses more on meeting the specific purposes, needs, and context of transportation projects and on identifying solutions that are considered sufficient to improve the transportation system without being excessive. Therefore, there is more flexibility in design, which will typically result in greater analysis and planning costs. However, the intended result is a more cost effective roadway solution.

ODOT has developed a strategy for Practical Design that provides a foundation for thought and processes to achieve more focused improvements at a lower cost, even if those improvements are not as long lived as traditional ODOT highway improvements. This strategy is presented in a guidebook that has the following sections:

- I. Philosophy
- II. Focus
- III. Roles and Responsibilities of Primary Decision Makers
- IV. Integrating Practical Design and Project Delivery
- V. Success Indicators
- VI. Future Improvements
- VII. Appendices

The guidebook identifies the focus of Practical Design in Oregon, as shown in box below (which was taken from page 9 of the guidebook).

**Q:** What's different with ODOT's Practical Design effort?

**A:** Our emphasis on **doing just what's needed for specific results.**

Our emphasis on making the **whole system** better, while **stretching our funding** so that it goes further.

Our **decision-making toolkit** - which helps us achieve our goals and live our values when making system improvements.

Our **emphasis on utilizing different perspectives and having all available information about a project, early in the process**, to frame up appropriate problem statements and cost-conscious solutions.

**Practical design in Oregon takes a systematic approach to deliver the broadest benefits to the transportation system, within existing resources, by establishing appropriate project scopes, to deliver specific results.**

ODOT has five key values associated with Practical Design. These values are represented by the acronym **S.C.O.P.E.:**

- **S**afety
- **C**orridor Context
- **O**ptimize the System
- **P**ublic Support
- **E**fficient Cost

The guidebook also states the following:

"Although it is not a "silver bullet," Practical Design **is** the next logical step for ODOT. It allows us to deliver the broadest benefits to the transportation system, within existing resources, by establishing appropriate project scopes to deliver specific results. It provides flexible parameters so that design teams can be confident that a particular solution is sufficient to improve the transportation system as a whole."

Additional information on ODOT's approach to Practical Design is provided on the following website:

- [http://www.oregon.gov/ODOT/HWY/TECHSERV/practical\\_design.shtml](http://www.oregon.gov/ODOT/HWY/TECHSERV/practical_design.shtml)

**Appendix B. Technical Memorandum #2, Highway 126 Fern Ridge Corridor Plan– Existing Transportation Conditions (DKS, 2011)**

## TECHNICAL MEMORANDUM #2

**TO:** Project Management Team

**FROM:** Scott Mansur, P.E., P.T.O.E., DKS Associates *SM*  
Peter Coffey, P.E., DKS Associates  
Brad Coy, E.I.T., DKS Associates

**DATE:** September 23, 2011

**SUBJECT:** **OR 126W Fern Ridge Corridor Plan – Existing Transportation Conditions**

P09042-019-004

This memorandum documents existing transportation conditions for OR 126W between Veneta and Eugene, Oregon (see Figure 1), and is part of the OR 126W Fern Ridge Corridor Plan. It identifies existing facilities as well as operational and safety deficiencies. The sections of this memorandum document the roadway network, daily motor vehicle traffic characteristics, origin-destination survey, intersection traffic volumes and operations, collision analysis, pedestrian and bicycle facilities and activity, transit service, and rail facilities and activity.

### Roadway Network

OR 126W is the primary east-west roadway in the study area and is a rural route between the cities of Eugene and Veneta. It traverses farmland, runs parallel to the Coos Bay rail line (CBRL), and skirts the southern edge of the Fern Ridge Reservoir, which is a popular recreational area. It is primarily used by commuters traveling between Eugene and Veneta, but it is also the primary route connecting the Eugene-Springfield area with the Oregon coast.

OR 126W is under Oregon Department of Transportation (ODOT) jurisdiction and is classified as a Statewide Highway. It is also part of the National Highway System (NHS), is a State Freight Route (FR), and is a Federally Designated Truck Route (TR). Table 1 lists the existing study area roadway characteristics of OR 126W as well as the primary cross streets in the study area that provide access to OR 126W. All study area roadways (including OR 126W) are two-lane facilities, though OR 126W widens on occasion to accommodate a left-turn lane at key intersections. In addition, none of the roadways have designated bike lanes or sidewalks, though OR 126W through the study area has shoulders that range from four to ten feet wide.

## Daily Motor Vehicle Traffic Characteristics

Daily motor vehicle traffic characteristics were evaluated along OR 126W using bi-directional traffic volumes, speeds, and vehicle classification data. The data was collected using roadway tubes on a summer weekday<sup>1</sup> at the following five locations:

- OR 126W east of Huston Road
- OR 126W west of Central Road
- OR 126W west of Fisher Road
- OR 126W west of Ken Nielsen Road
- OR 126W west of Green Hill Road

Figure 2 shows the bi-directional average daily traffic (ADT) volumes, 85<sup>th</sup> percentile speeds,<sup>2</sup> and heavy vehicle percentages recorded at these five locations. The ADTs along the corridor range between 13,390 and 15,850 vehicles per day, with the greatest volumes occurring in the center of the corridor near Fisher Road. Heavy vehicle activity ranges from three to five percent along the corridor. The 85<sup>th</sup> percentile speed exceeds the 55-mph speed limit by more than 5 mph at the four westernmost locations.

<sup>1</sup> All Traffic Data 24-hour classification and speed counts were collected on Thursday, June 2, 2011.

<sup>2</sup> The 85<sup>th</sup> percentile speed is defined as the speed below which 85 percent of the vehicles are traveling.

Figure 3 provides additional insight regarding traffic trends by comparing the bi-directional traffic volumes by the hour of the day. As shown, there is a significant eastbound morning peak of approximately 800 vehicles per hour (vph) between 7:00 a.m. and 8:00 a.m., which drops off but then maintains a fairly consistent 400 vph until approximately 5 p.m. In the westbound direction, hourly traffic volumes gradually build throughout the day, with peak volumes of approximately 800 vph between 4:00 p.m. and 6:00 p.m. Therefore, this graph shows a distinct commuter trend during the weekday as Veneta residents drive to work in Eugene for the morning and then return home in the evening.

Figure 2: Daily Motor Vehicle Traffic Characteristics

Figure 3: Bi-Directional Volume Comparison by Hour of the Day (Summer Weekday)

## Origin-Destination Survey

To understand the use of OR 126W to travel to, from, or through Veneta, an origin-destination (O-D) survey utilizing MAC address (i.e., Bluetooth) sampling was conducted over three weekdays in June 2011.<sup>3</sup> Three data collection points were used to estimate the percentage of vehicles originating in or destined for Veneta or the surrounding areas versus the percentage of vehicles remaining on OR 126W and traveling through Veneta. The O-D survey collection points included the following (which are shown in Figure 4):

- West of 8th Avenue on OR 126 (west of Veneta)
- East of Ellmaker on OR 126 (near western study corridor extent)
- West of Green Hill Road on OR 126 (near eastern study corridor extent)

MAC addresses recorded at all three collection points indicate a through trip that remains on OR 126W, while those only recorded at one or two points indicate a trip either beginning or ending in Veneta or somewhere within the study corridor. Figure 4 shows the origin-destination survey results as percentages of vehicles entering the study corridor at the two ends of OR 126W. Of the recorded westbound vehicles entering the study area, the O-D surveys indicate that approximately 25 percent turn off of OR 126W prior to reaching Veneta, 50 percent turn off within Veneta, and 25 percent pass through Veneta and continue westbound on OR 126W. Of the recorded eastbound vehicles entering Veneta, the O-D surveys indicate that approximately 50 percent are destined for Veneta while the remaining 50 percent stay on OR 126W and continue eastbound towards Eugene.

## Intersection Traffic Volumes and Operations

Traffic volumes were collected and operating conditions were analyzed at each of the following study intersections and driveways along the OR 126W study corridor.

- OR 126/Huston Road
- OR 126/ 13 existing private driveways between Huston Road and Ellmaker Road
- OR 126/Ellmaker Road
- OR 126/Shady Rest Drive
- OR 126/Lake Side Drive
- OR 126/Central Road
- OR 126/Fisher Road
- OR 126/Richmond Street
- OR 126/Ken Nielsen Road
- OR 126/Green Hill Road

The 30<sup>th</sup> highest hourly volumes, average annual weekday volumes, intersection performance, and turn lane needs are documented in this section of the memorandum.

---

<sup>3</sup> Bluetooth sampling was conducted for full 24-hour periods on June 2<sup>nd</sup> (Thursday), 3<sup>rd</sup> (Friday), and 6<sup>th</sup> (Monday), 2011.

### ***30<sup>th</sup> Highest Hourly Volumes***

ODOT's Analysis Procedures Manual (APM) indicates that existing conditions operations analysis is to be performed using the 30<sup>th</sup> highest hour volume (30<sup>th</sup> HV).<sup>4</sup> The 30<sup>th</sup> HV for the OR 126W study corridor intersections were determined by following three steps:

- Step 1 – Collect Peak Hour Traffic Counts
- Step 2 – Apply Seasonal Factor
- Step 3 – Round and Balance Volumes

#### ***Step 1 – Collect Peak Hour Traffic Counts***

Motor vehicle turn movement counts were collected at the study intersections and driveways for the a.m. and p.m. peak periods.<sup>5</sup> Based on the raw data, which are provided in the appendix, the system peak hours for the corridor were determined to be 7:15 to 8:15 a.m. and 4:45 to 5:45 p.m.

#### ***Step 2 – Apply Seasonal Factor***

A seasonal factor was applied to each study intersection to calculate the 30<sup>th</sup> HV. Three optional methods for calculating a seasonal factor are outlined in ODOT's Analysis Procedures Manual (APM). These three methods are listed in order of preference, though specific requirements must be met for each to be used:

- Option 1 – On-Site Automatic Traffic Recorder (ATR)
- Option 2 – ATR Characteristics Table
- Option 3 – ATR Seasonal Trend Table

Option 1 is not applicable because the study corridor does not have an on-site ATR. Option 2 is also not applicable because there are no other ATRs in Oregon that have sufficiently similar characteristics as those exhibited by the study corridor. Therefore, the ATR Seasonal Trend method was used to determine the seasonal adjustment factor. Because OR 126W serves a mix of commuter traffic and coastal destination traffic,<sup>6</sup> the average of these two traffic trend characteristics was used. The result for the June 2, 2011, intersection turn movement count date is a seasonal adjustment factor<sup>7</sup> of 1.11. The raw system p.m. peak hour turn movement volumes were multiplied by this factor to determine the 30<sup>th</sup> HV. The raw system a.m. peak hour volumes were also multiplied by this factor to determine the corresponding a.m. peak hour design volumes to use for existing conditions analysis.

#### ***Step 3 – Round and Balance Volumes***

The 30<sup>th</sup> highest hourly volumes were rounded and balanced as appropriate based on direction provided in the APM. Rounding helps clarify that absolute precision is not expected for the traffic

---

<sup>4</sup> Analysis Procedures Manual, Oregon Department of Transportation, January 2011, page 4-1.

<sup>5</sup> All Traffic Data turn movement counts were collected on Thursday, June 2, 2011, from 6-9 a.m. and 3-6 p.m.

<sup>6</sup> The OR 126W study corridor between Veneta and Eugene serves commuter traffic for Veneta residents. In addition, it is the primary coastal access route for the Eugene-Springfield metropolitan area, and the APM indicates that the Florence-Eugene Highway (OR 126) is characterized by the "Coastal Designation" trend.

<sup>7</sup> The 2010 Seasonal Trend Table and associated calculations are provided in the appendix.

volumes, and balancing ensures that reasonable progression on a corridor is being considered. However, for very low volume turn movements (i.e., less than three vehicles) rounding was not performed. Instead, the actual volumes are shown for clarity in reporting where turn movements actually occurred. Figure 5 provides the 30<sup>th</sup> HV (and the associated a.m. peak hour volumes) for the OR 126W study intersection that results from rounding and balancing.<sup>8</sup> This figure also identifies the existing intersection traffic control and turn lane geometries.

### ***Average Annual Weekday Volumes***

The average annual weekday traffic volumes for the OR 126W study corridor intersections were determined in a similar manner as the 30<sup>th</sup> HV. The only difference was that because June volumes are higher than average, the raw system p.m. peak hour turn movement volumes were multiplied by 0.95 factor (i.e., reduced by five percent).<sup>9</sup> The raw system a.m. peak hour volumes were also multiplied by this factor to determine the corresponding a.m. peak hour design volumes. The volumes were then rounded and balanced as previously discussed. Figure 6 shows the resulting annual average weekday turn movement counts for each of the study intersections.

---

<sup>8</sup> Turn movement volumes at the driveways of less than 3 vehicles were not rounded to avoid either rounding down to zero or inflating the volumes, due to the significant number of low volume driveways on the study corridor.

<sup>9</sup> The average annual weekday factor was also determined using the 2010 Seasonal Trend Table, with calculation provided in the appendix.

## Intersection Performance

The performance of each OR 126W study corridor intersection under 30<sup>th</sup> HV and average annual conditions was evaluated and compared to the applicable volume-to-capacity (v/c) mobility standard(s),<sup>10</sup> as required by ODOT and Lane County. Table 2 shows the applicable mobility standards for the OR 126W study corridor intersections. The ODOT mobility standards are controlling because they require the intersection to operate at a lower v/c ratio.

| County Roads (worst movement)                     | N/A                                                                                                       | 0.80                                                                                              | N/A                                                                                               |

<sup>a</sup> ODOT operating standards obtained from August 2005 version of Table 6 in OHP, Lane County operating standards obtained from Table 6 of 2004 Lane County TSP.

<sup>b</sup> At signalized intersections, these standards are to be applied to the intersection as a whole. At unsignalized intersections, these standards are applicable only to movements that are not required to stop.

<sup>c</sup> For movements at unsignalized intersections that are required to stop or otherwise yield the right of way, the standards for District/Local Interest Roads shall be applied for areas within urban growth boundaries and a maximum v/c ratio of 0.80 shall be applied for areas outside of urban growth boundaries.

The operating performance of the study intersections were evaluated using Synchro™ software, which employs methodology from the *2000 Highway Capacity Manual*.<sup>11</sup> The traffic volumes, traffic control, and lane configurations shown in Figure 5 and Figure 6 were used in the analysis.<sup>12</sup> Table 3 (30<sup>th</sup> highest hour) and Table 4 (average annual weekday peak hours) provide the volume-to-capacity ratios for the public intersections (both signalized and unsignalized) as well as the private driveways located between Huston Road and Ellmaker Road. As shown, all intersections and driveways meet applicable mobility standards for both peak periods and under 30<sup>th</sup> HV and average annual peak hour traffic conditions. The only intersection approaching the mobility standard is OR 126W/Green Hill Road, which the eastern most intersection, is the only signalized intersection, and is the only intersection inside the Eugene UGB.

<sup>10</sup> The volume-to-capacity (v/c) ratio is a decimal representation (between 0.00 and 1.00) of the proportion of capacity that is being used (i.e., the saturation) at a turn movement, approach leg, or intersection. It is determined by dividing the peak hour traffic volume by the hourly capacity of a given intersection or movement. A lower ratio indicates smooth operations and minimal delays. As the ratio approaches 1.00, congestion increases and performance is reduced. If the ratio is greater than 1.00, the turn movement, approach leg, or intersection is oversaturated and usually results in excessive queues and long delays.

<sup>11</sup> *2000 Highway Capacity Manual*, Transportation Research Board, Washington, D.C. 2000.

<sup>12</sup> Intersection signal timing for the OR 126W/Green Hill Road intersection was obtained from the City of Eugene and used in the analysis.

<sup>d</sup> **Bold Shaded** values do not meet mobility standards.

### **Turn Lane Needs**

For most of its length through the study corridor, OR 126W is a two-lane roadway; however, there are multiple intersections where OR 126W has turn lanes. At intersections where turn lanes do not currently exist, applicable criteria from ODOT's Analysis Procedures Manual (APM)<sup>13</sup> were considered to determine whether additional left- and right- turn lanes are recommended.

Due to the high peak hour traffic volumes and travel speeds (55 mph) on OR 126W, the ODOT criteria indicate that left-turn lanes are needed at movements where volumes exceed ten left-turning vehicles during the 30<sup>th</sup> highest hour. Table 5 lists the left-turn lane analysis results for the study intersections that do not currently have left-turn lanes. While the ten-vehicle threshold is not met for any of the study intersections, the ODOT criteria do also indicate that left-turn lanes would be beneficial and may be considered at these locations due to the higher travel speeds and traffic volumes.

**Table 5: Existing Left-Turn Lane Criteria (Intersections without Left-Turn Lanes)**

| Intersection           | Movement | Left-Turn Vehicles |             | Criteria Met?         | Recommended Storage Length |
|------------------------|----------|--------------------|-------------|-----------------------|----------------------------|
|                        |          | ODOT Threshold     | Turn Volume |                       |                            |

| OR 126W/Ken Nielson Rd | WB Left  | 10                 | 5           | Consider <sup>a</sup> | -                          |

<sup>a</sup> Through volumes and speeds are sufficiently high that even though there are less than ten turning vehicles, careful consideration be given to installing a left-turn lane due to the increased potential for accidents in the through lanes.

Left-turn lane analysis was also performed for the 13 driveways between Huston Road and Ellmaker Road and is provided in the appendix. Because two of the driveways (i.e., Driveways 10 and 12, which are approximately 230 feet and 720 feet, respectively, west of Ellmaker Road) have more than ten vehicles making left-turn movements, they both meet the turn-lane criteria. Both of these driveways are along the section of OR 126W where it widens to accommodate the eastbound left-turn lane onto Ellmaker Road. Therefore, OR 126W is sufficiently wide to accommodate left-turn lanes at both driveways; however, current striping does not support the use of the center median/lane for vehicle storage at these driveways. Specifically, the eastbound left-turn lane for Ellmaker Road extends beyond Driveway 12, and there is a striped center median (i.e., two double-yellow lines) that extends farther west beyond Driveway 10.

Right-turn lane analysis was performed for the study intersections that do not currently have standard right-turn lanes. Due to the high traffic volumes and travel speeds (55 mph) on OR 126W, the ODOT criteria indicate that right-turn lanes are needed at movements where volumes exceed approximately 20 right-turning vehicles during the 30<sup>th</sup> highest hour. Table 6 lists right-turn lane

<sup>13</sup> Analysis Procedures Manual, Oregon Department of Transportation, January 2011.

analysis results. The only location where the right-turn lane criteria are met is at the westbound right-turn movement at Ellmaker Road. This location currently has a flared approach and large turn radius that may partially serve as a right-turn lane, but it is recommended that a standard right-turn lane be provided.

**Table 6: Existing Right-Turn Lane Criteria (Intersections without Right-Turn Lanes)**

## Collision Analysis

Collision analysis was performed for the OR 126W study corridor using collision records provided by the ODOT Crash Analysis and Reporting Unit. The past 16 years of data (i.e., 1994 to 2009) were first reviewed to identify long-term trends as well as fatalities and pedestrian/bicycle collisions. Then, collision rates were analyzed for the most recent five years of available data (i.e., 2005 through 2009), consistent with ODOT standard methodology.

Between January 1, 1994, and December 31, 2009, 310 collisions were recorded on OR 126W between Huston Road and Green Hill Road. Therefore, over the last 16 years this six mile section of highway has averaged approximately 20 collisions per year. Eight of these collisions resulted in fatalities<sup>14</sup> and 22 resulted in debilitating injuries (i.e., an average of two fatalities or debilitating injuries per year). Nearly half of the recorded collisions resulted in injuries, with two of these collisions involving pedestrians and three of them involving bicyclists; the bicycle and pedestrian collisions occurred near Ellmaker Road, Central Road, the scenic viewpoint between these two roads, and between Central Road and Fisher Road.

Another helpful measure for identifying collision trends is the five-year rolling average. Figure 7 shows the five-year rolling average for total collisions and fatalities/disabling injuries per year relative to the vehicle-miles traveled along the 6-mile corridor. While vehicle-miles traveled has been relatively unchanged at approximately 80,000 vehicle-miles per day, the average number of collisions has been increasing since 2002 from a low of 13.2 collisions per year to a current high of

<sup>14</sup> There were nine total fatalities because one of the collisions resulted in two fatalities.

24.8 collisions per year. The average number of fatalities or debilitating injuries has been fairly steady between 1.8 and 3.0 fatalities or debilitating injuries per year.

**Figure 7: OR 126W Collisions Relative to Vehicle-Miles Traveled (Five Year Rolling Average)**

Figure 8 shows how the 310 collisions are distributed along the study corridor and also identifies the collision severity. As shown, five of the eight fatal collisions occurred in the eastern third of the study corridor. This same segment (i.e., from Green Hill Road to Fisher Road) also has a higher proportion of all collisions on the study corridor, with a particular spike in injury collisions near Green Hill Road and Fisher Road. There are also spikes in collisions at Central Road, Ellmaker Road, and Huston Road. These are expected locations due to the additional turning movements that occur at these locations. In addition, because of citizen-reported collision information in Oregon, some ODOT collision records only specify the general milepoint; therefore, there appear to be spikes at these locations, but it is likely that these collisions should be more evenly distributed throughout the milepoint.

# COLLISION LOCATIONS (1994 TO 2009)

\*Note: Some ODOT collision records only specify the general milepoint.

Collision rates were also estimated for OR 126W, but only the past five years of collision data were evaluated due to changing traffic characteristics over time and to allow a comparison of collision rates on similar facilities throughout the State of Oregon. Table 7 lists the average collision rate for OR 126W between Veneta and Eugene, which is slightly higher than that of other similar highways in Oregon. The table also indicates that the average fatality and debilitating injury rate is lower than other similar highways in Oregon. However, as shown previously in Figure 9, the total number of collisions on OR 126W have been increasing since 2002. This is the opposite trend of the average collision rate for the state, which has been steadily dropping during the same time period. Another important item of note is that this segment of OR 126W does not currently have any top five or ten percent ODOT Safety Priority Index System (SPIS) locations identified (for the 2009 SPIS, which is based on collisions from 2007 to 2009). However, the intersection of OR 126/Green Hill Road has been identified as a top 15% SPIS site.

**Table 7: OR 126W Collision Rates Compared with Statewide Averages (2005 to 2009)**

| <b>Facility</b>                                | <b>Total Collision Rate<sup>a,b</sup></b> | <b>Fatal/Debilitating Injury Rate<sup>a,b</sup></b> |
|------------------------------------------------|-------------------------------------------|-----------------------------------------------------|
| OR 126W between Veneta and Eugene              | 0.82 per million VMT                      | 5.93 per 100 million VMT                            |
| Oregon Principal Arterials (Statewide Average) | 0.67 per million VMT                      | 8.44 per 100 million VMT                            |

<sup>a</sup> Collision Rate = (collisions\*1,000,000)/(years\*365\*segment length\*AADT)

<sup>b</sup> VMT = Vehicle Miles Traveled

Additional breakdowns of collisions were performed to evaluate the severity and type of collisions that occurred on the study corridor. Table 8 provides a breakdown by severity of the 124 collisions reported between 2005 and 2009. Two of the collisions were fatalities, and over half resulted in injuries.

**Table 8: Collision Severity on OR 126W (2005 to 2009)**

The study corridor collisions were also broken down by collision type for further evaluation. Figure 9 is a pie chart showing the percent of each type of collision. On the study corridor, more than 60% of the collisions were intersection related and were classified as rear-end, angle, or turning-movement collisions. The locations of the collisions (broken down by collision type) are provided in the appendix.

**Figure 9: OR 126W Collision Types (2005 to 2009)**

Another important consideration for the OR 126W study corridor is the effect that passing maneuvers have on corridor safety. While this information is not directly identified in the collision data, the collision records do indicate whether the driver drove left of the centerline (five collisions between 2005 and 2009) or performed improper overtaking (two collisions); these seven collisions comprise six percent of the total 124 collisions and include a fatality.

## **Pedestrian and Bicycle Facilities and Activity**

As previously discussed, the segment of OR 126W between Huston Road and Green Hill Road is a rural corridor with no sidewalks or designated bicycle lanes and with shoulders that range from four to ten feet wide. These narrow shoulders force cyclists to travel immediately adjacent to and often on the edge of the vehicular travel lane.

Some expected multi-modal destinations include the county park (Perkins Peninsula County Park) located approximately two miles east of the Veneta city limits, the Fern Ridge Reservoir, and transit stops along the corridor. Pedestrian and bicycle traffic recorded during the weekday a.m. and p.m. peak motor vehicular periods are shown in Figure 10. As shown, few pedestrians and no bicyclists were observed during these periods.

**Figure 10: Pedestrian and Bicycle Facilities and Activity on OR 126W**

## Transit Service

Lane Transit District (LTD) provides public transit service between the Eugene-Springfield area and Veneta. LTD Route 93 route extends from Eugene Station on the east to West Lane Shopping Center in Veneta on the west, and Eugene Station has connections to downtown Eugene. Figure 11 shows Route 93, the locations of the bus stops, and the average weekday ons and offs that were collected during the month of May 2011.

Table 9 lists the current Route 93 transit service. There are eight regularly scheduled weekday trips beginning at approximately 7:00 am and ending at 6:00 pm. There are two regularly scheduled Saturday trips. Productivity on rural routes is measured in terms of the number of customer boardings per round trip. LTD's current standard is 30 boardings per trip. Route 93 averages 42 boardings per trip within the study area. The greatest activity occurs in the vicinity of the OR 126/Elmaker Road intersection, though most bus stop locations have an average of one or two daily boardings and alightings (i.e., ons and offs).<sup>15</sup>

**Table 9: Route 93 (Veneta) Transit Service**

| Service Period   | Hours of Operation | Headway                       |
|------------------|--------------------|-------------------------------|
| Monday-Friday    |                    |                               |
| A.M. Peak Period | 6:40 to 11:00 a.m. | 30, 60, or 120 min. (4 buses) |
| P.M. Peak Period | 1:40 to 7:00 p.m.  | 60 or 120 min. (4 buses)      |
| Saturday         |                    |                               |
| A.M. Peak Period | 9:30 to 10:40 a.m. | 1 bus                         |
| P.M. Peak Period | 4:50 to 6:00 p.m.  | 1 bus                         |

## **Rail Facilities and Activity**

The Coos Bay Rail Line (CBRL) runs parallel and in close proximity to OR 126W (less than 75 feet south of highway) for the segment between Huston Road and Richmond Street (approximately 4.5 miles). The rail line has not experienced any activity since 2007 but is scheduled to resume operation by October 2011. There are presently two gated and four stop controlled railroad crossings along the OR 126W study corridor. Three of the crossings are along public streets and the remaining three are along private roads. Figure 3-4 shows the location and a picture of each of the six railroad crossings.

All of the crossing locations, with the exception of Green Hill Road are within approximately 50 feet of the edge of the traveled way on OR 126W. At most, this allows for the storage of one or two vehicles between OR 126W and the railroad crossing. The Green Hill Road crossing is approximately one-third mile north of OR 126W; however, it is along a higher volume roadway. Lane County has received approval from the ODOT Rail Division to install a signalized crossing at the Green Hill Road at-grade railroad crossing.

\*Seasonal Trend Table factors are based on previous year ATR data and the table is updated yearly.

Average for June 1st = 0.95 = Factor for adjustment to average annual traffic

Average for Peak Period = 0.86

$$\frac{X}{X} = 1.11 \text{ Seasonal factor for 30th HV}$$

## **Level of Service Descriptions**

---

## TRAFFIC LEVELS OF SERVICE

Analysis of traffic volumes is useful in understanding the general nature of traffic in an area, but by itself indicates neither the ability of the street network to carry additional traffic nor the quality of service afforded by the street facilities. For this, the concept of *level of service* has been developed to subjectively describe traffic performance. Level of service can be measured at intersections and along key roadway segments.

Level of service categories are similar to report card ratings for traffic performance. Intersections are typically the controlling bottlenecks of traffic flow and the ability of a roadway system to carry traffic efficiently is generally diminished in their vicinities. Levels of Service A, B and C indicate conditions where traffic moves without significant delays over periods of peak travel demand. Level of service D and E are progressively worse peak hour operating conditions and F conditions represent where demand exceeds the capacity of an intersection. Most urban communities set level of service D as the minimum acceptable level of service for peak hour operation and plan for level of service C or better for all other times of the day. The *Highway Capacity Manual* provides level of service calculation methodology for both intersections and arterials.<sup>1</sup> The following two sections provide interpretations of the analysis approaches.

---

<sup>1</sup> 2000 *Highway Capacity Manual*, Transportation Research Board, Washington D.C., 2000, Chapters 16 and 17.

## UNSIGNALIZED INTERSECTIONS (Two-Way Stop Controlled)

Unsignalized intersection level of service is reported for the major street and minor street (generally, left turn movements). The method assesses available and critical gaps in the traffic stream which make it possible for side street traffic to enter the main street flow. The *2000 Highway Capacity Manual* describes the detailed methodology. It is not unusual for an intersection to experience level of service E or F conditions for the minor street left turn movement. It should be understood that, often, a poor level of service is experienced by only a few vehicles and the intersection as a whole operates acceptably.

Unsignalized intersection levels of service are described in the following table.

| Level of Service | Expected Delay                                                                   | (Sec/Veh)  |
|------------------|----------------------------------------------------------------------------------|------------|
| —                |                                                                                  |            |
| A                | Little or no delay                                                               | 0-10.0     |
| B                | Short traffic delay                                                              | >10.1-15.0 |
| C                | Average traffic delays                                                           | >15.1-25.0 |
| D                | Long traffic delays                                                              | >25.1-35.0 |
| E                | Very long traffic delays                                                         | >35.1-50.0 |
| F                | Extreme delays potentially affecting other traffic movements in the intersection | > 50       |

## SIGNALIZED INTERSECTIONS

For signalized intersections, level of service is evaluated based upon average vehicle delay experienced by vehicles entering an intersection. Control delay (or signal delay) includes initial deceleration delay, queue move-up time, stopped delay, and final acceleration delay. In previous versions of this chapter of the HCM (1994 and earlier), delay included only stopped delay. As delay increases, the level of service decreases. Calculations for signalized and unsignalized intersections are different due to the variation in traffic control. The *2000 Highway Capacity Manual* provides the basis for these calculations.

| Level of Service                                                                             | Delay (secs.) | Description                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------------------------------------------------------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| A                                                                                            | $\leq 10.00$  | <b>Free Flow/Insignificant Delays:</b> No approach phase is fully utilized by traffic and no vehicle waits longer than one red indication. Most vehicles do not stop at all. Progression is extremely favorable and most vehicles arrive during the green phase.                                                                                                                            |
| B                                                                                            | 10.1-20.0     | <b>Stable Operation/Minimal Delays:</b> An occasional approach phase is fully utilized. Many drivers begin to feel somewhat restricted within platoons of vehicles. This level generally occurs with good progression, short cycle lengths, or both.                                                                                                                                        |
| C                                                                                            | 20.1-35.0     | <b>Stable Operation/Acceptable Delays:</b> Major approach phases fully utilized. Most drivers feel somewhat restricted. Higher delays may result from fair progression, longer cycle lengths, or both. Individual cycle failures may begin to appear at this level, and the number of vehicles stopping is significant.                                                                     |
| D                                                                                            | 35.1-55.0     | <b>Approaching Unstable/Tolerable Delays:</b> The influence of congestion becomes more noticeable. Drivers may have to wait through more than one red signal indication. Longer delays may result from some combination of unfavorable progression, long cycle lengths, or high v/c ratios. The proportion of vehicles not stopping declines, and individual cycle failures are noticeable. |
| E                                                                                            | 55.1-80.0     | <b>Unstable Operation/Significant Delays:</b> Volumes at or near capacity. Vehicles may wait through several signal cycles. Long queues form upstream from intersection. These high delay values generally indicate poor progression, long cycle lengths, and high v/c ratios. Individual cycle failures are a frequent occurrence.                                                         |
| F                                                                                            | $\geq 80.0$   | <b>Forced Flow/Excessive Delays:</b> Represents jammed conditions. Queues may block upstream intersections. This level occurs when arrival flow rates exceed intersection capacity, and is considered to be unacceptable to most drivers. Poor progression, long cycle lengths, and v/c ratios approaching 1.0 may contribute to these high delay levels.                                   |
